## **Source Code Management File**

Subject Name: **Source Code Management (SCM)**

Subject Code: **CS181**

Cluster: **Beta**

### **Submitted By:**

Name: **Aastha Anand**

Roll No. **2110990024**

Group: **G01-A**

### **Task 1.1 Submission (Week 4)**

1. Setting up of Git Client
2. Setting up GitHub Account
3. Generate logs
4. Create and visualize branches
5. Git lifecycle description

# Experiment 1

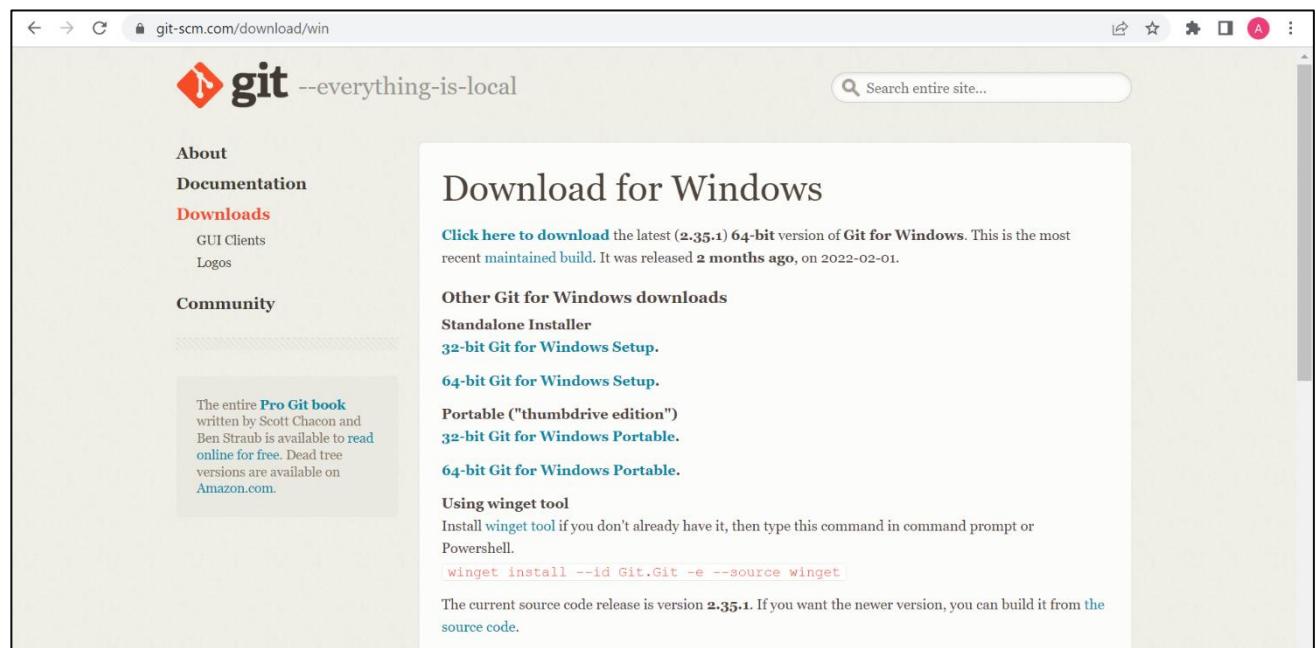

**Aim:** Setting up of Git Client

## Theory:

GIT: It's a Version Control System (VCS). It is a software or we can say a server by which we are able to track all the previous changes in the code. It is basically used for pushing and pulling of code. We can use git and git-hub parallelly to work with multiple members or individually. We can make, edit, recreate, copy or download any code on git hub using git.

**Procedure:** We can install Git on Windows, using the most official build which is available for download on the GIT's official website or by just typing (scm git) on any search engine. We can go on <https://git-scm.com/download/win> and can select the platform and bit-version to download. And after clicking on your desired bit-version or ios it will start downloading automatically.

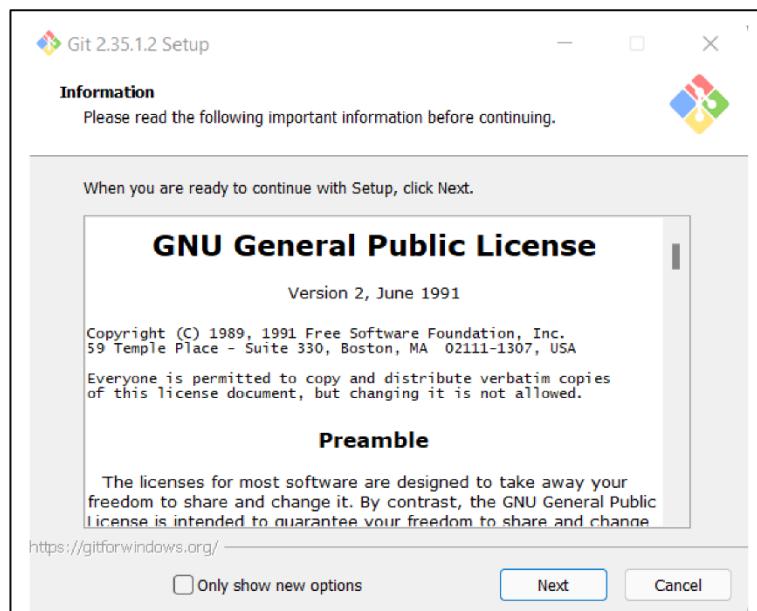

## Snapshots of download:

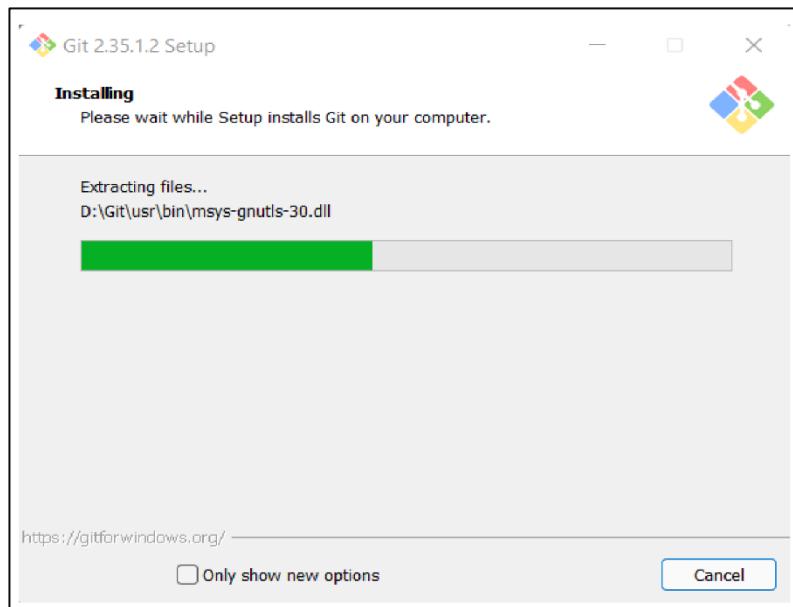

Opted for “64-bit Git for Windows Setup”

Name	Date modified	Type	Size
Git Bash	16-03-2022 08:51	Shortcut	2 KB
Git CMD	16-03-2022 08:51	Shortcut	2 KB
Git FAQs (Frequently Asked Questions)	16-03-2022 08:51	Internet Shortcut	1 KB
Git GUI	16-03-2022 08:51	Shortcut	2 KB
Git Release Notes	16-03-2022 08:51	Shortcut	2 KB

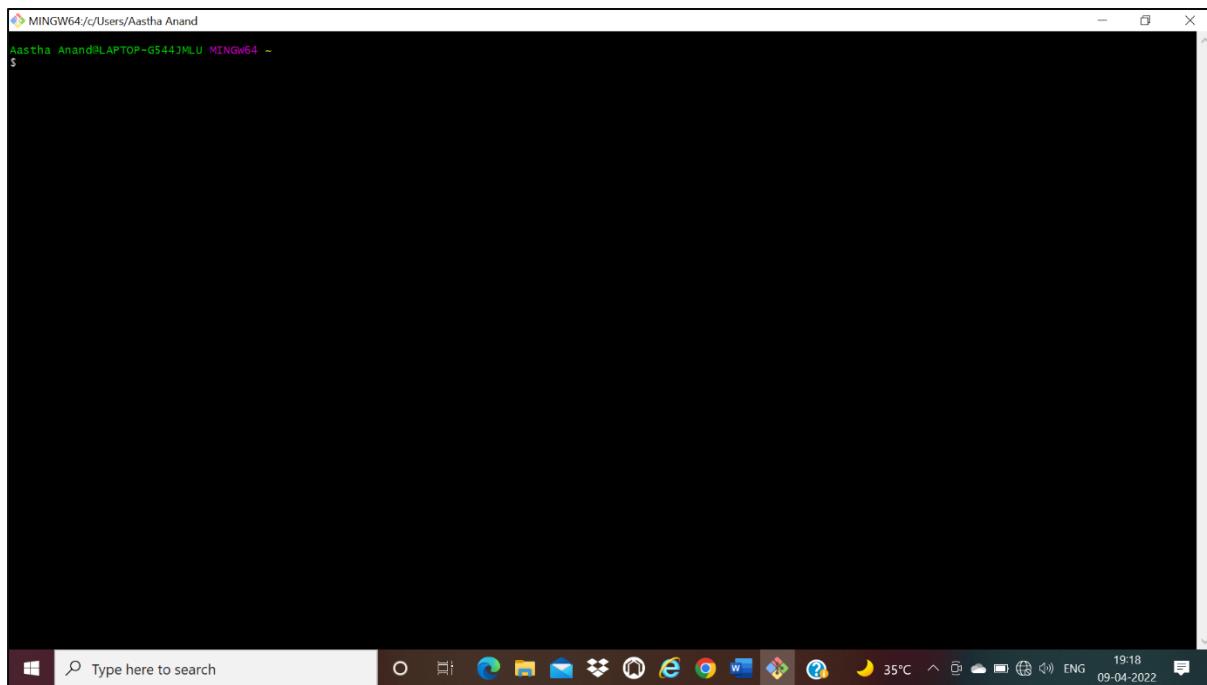

## Git and its files in downloads

## Git Setup

## Git Installation

Git Bash launched

# Experiment 2

**Aim:** Setting up GitHub Account

## Theory:

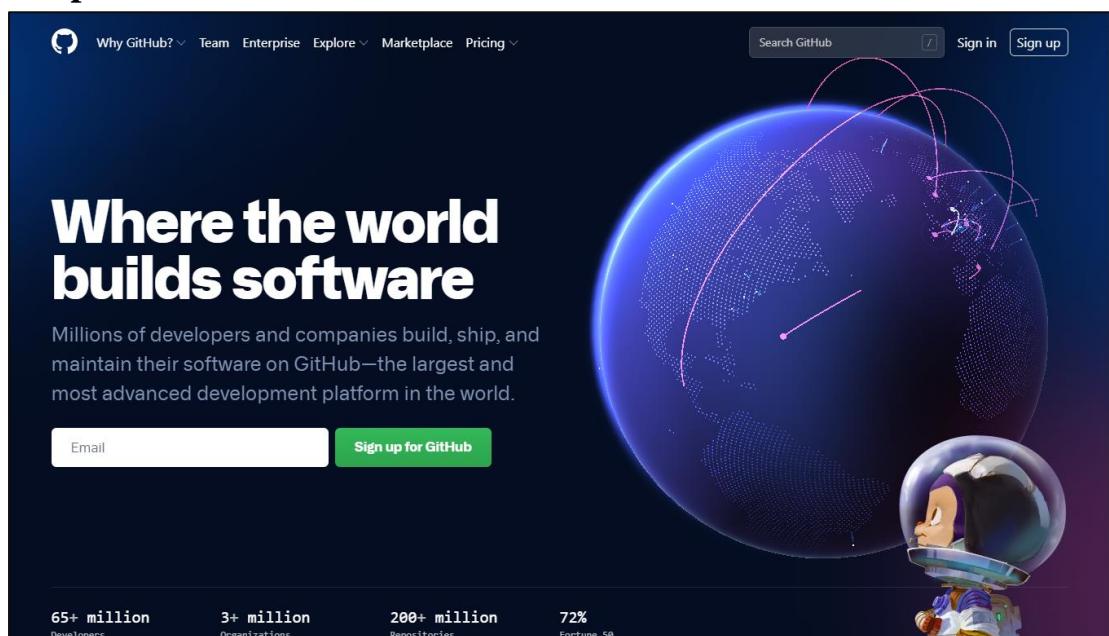

**GitHub:** GitHub is a website and cloud-based service (client) that helps an individual or developers to store and manage their code. We can also track as well as control changes to our or public code.

**Advantages of GitHub:** GitHub has a user-friendly interface and is easy to use. We can connect the git-hub and git but using some commands shown below in figure 001. Without GitHub we cannot use Git because it generally requires a host and if we are working for a project, we need to share it will our team members, which can only be done by making a repository. Additionally, anyone can sign up and host a public code repository for free, which makes GitHub especially popular with open-source projects.

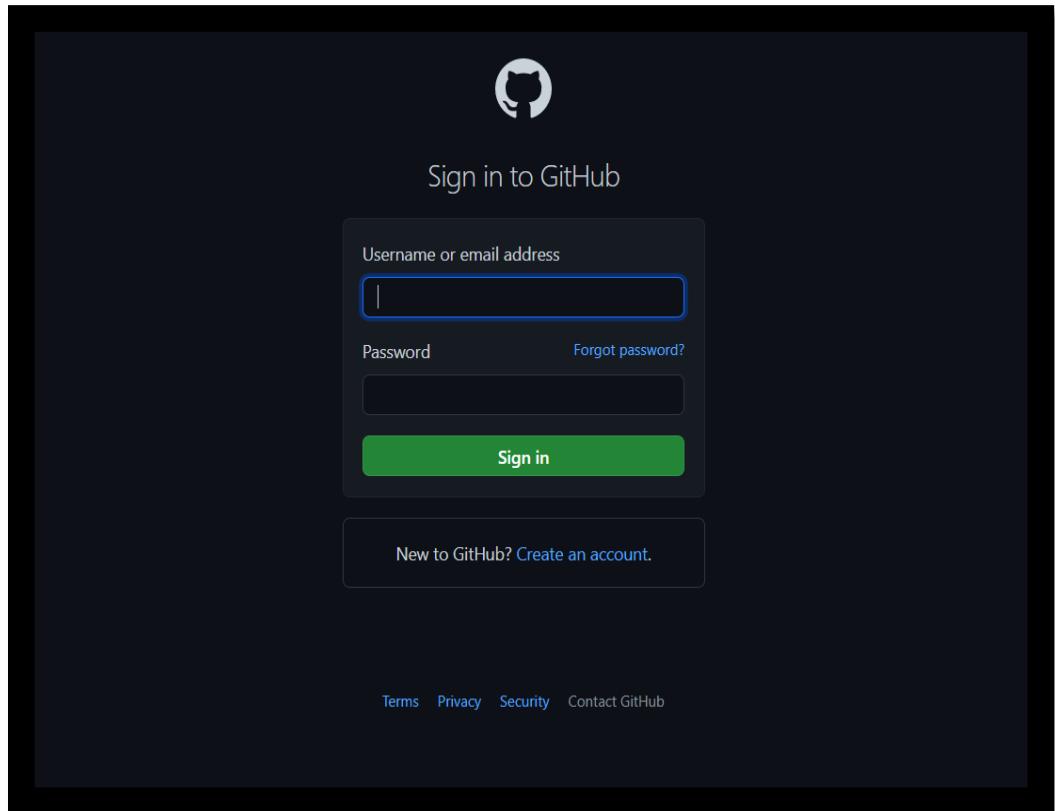

## Procedure:

To make an account on GitHub, we search for GitHub on our browser or visit <https://github.com/signup>. Then, we will enter our mail ID and create a username and password for a GitHub account.

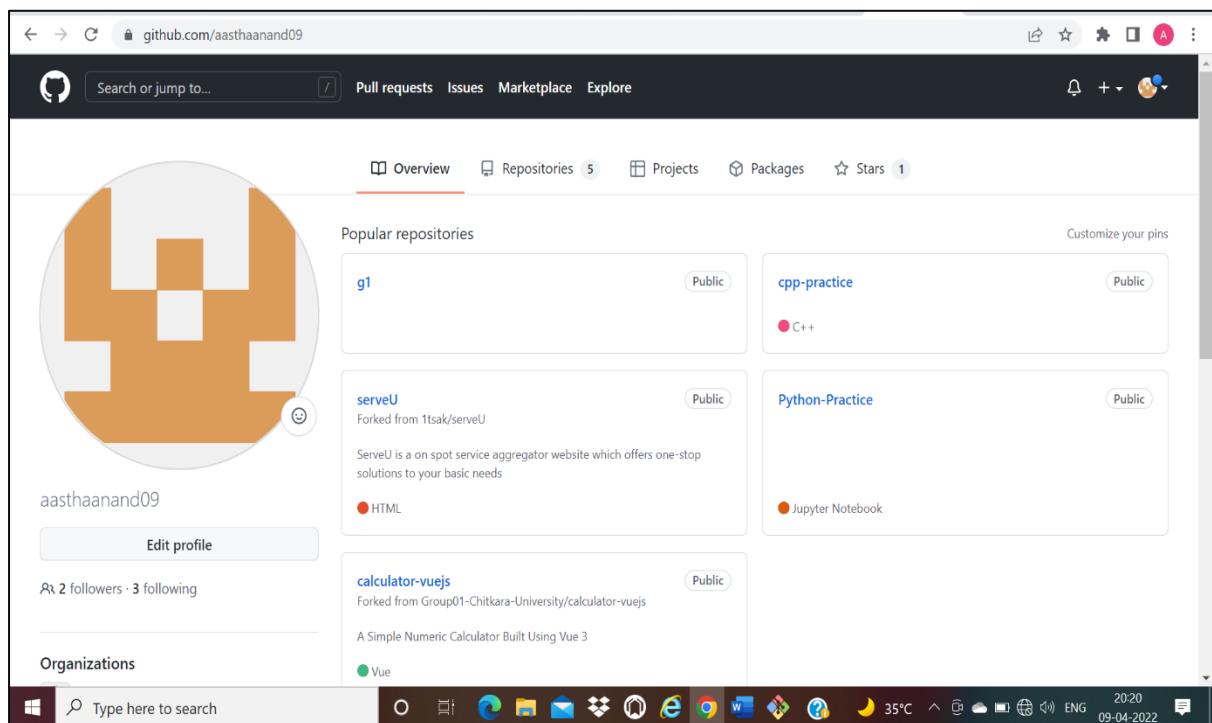

## Snapshots –

After visiting the link this type of interface will appear, if you already have an account, you can sign in and if not, you can create.

## GitHub Login

A screenshot of a GitHub user profile page. The URL in the browser is "github.com/aasthaanand09". The profile picture is a circular icon with a stylized orange and white geometric pattern. The username "aasthaanand09" is displayed below the profile picture. To the right of the profile picture are tabs for "Overview", "Repositories" (5), "Projects", "Packages", and "Stars" (1). The "Overview" tab is active. Below the tabs, there is a section titled "Popular repositories" showing five repositories: "g1" (Public), "serveU" (Forked from 1tsak/serveU), "calculator-vuejs" (Forked from Group01-Chitkara-University/calculator-vuejs), "cpp-practice" (Public, C++), and "Python-Practice" (Public, Jupyter Notebook). On the far right, there is a "Customize your pins" section. At the bottom of the page is a search bar with the placeholder "Type here to search" and a taskbar with various icons.

## GitHub Interface

# Experiment 3

**Aim:** Program to Generate log

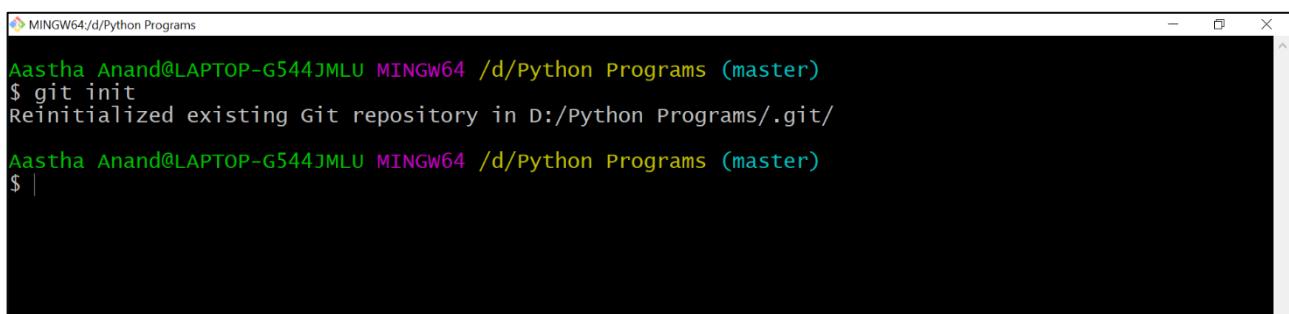

## Theory:

Logs: Logs are nothing but the history which we can see in git by using the code git log.

It contains all the past commits, insertions and deletions in it which we can see any time. Logs helps to check that what were the changes in the code or any other file and by whom. It also contains the number of insertions and deletions including at which time it was changed.

## Procedure:

First of all, create a local repository using Git. For this, you have to make a folder in your device, right click and select “Git Bash Here”. This opens the Git terminal. To create a new local repository, use the command “git init” and it creates a folder “.git”.

```
MINGW64:/d/Python Programs
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git init
Reinitialized existing Git repository in D:/Python Programs/.git/
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ |
```

When we use GIT for the first time, we have to give the user name and email so that if I am going to change in project, it will be visible to all.

For this, we use command:

“git config --global user.name Name”  
“git config --global user.email email”

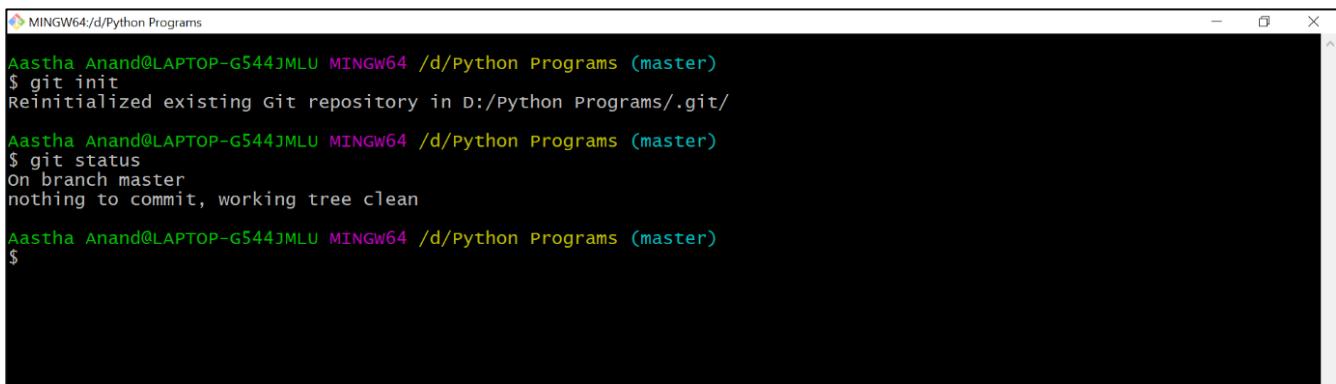

For verifying the user’s name and email, we use:

“git config --global user.name”  
“git config --global user.email”

## Some Important Commands

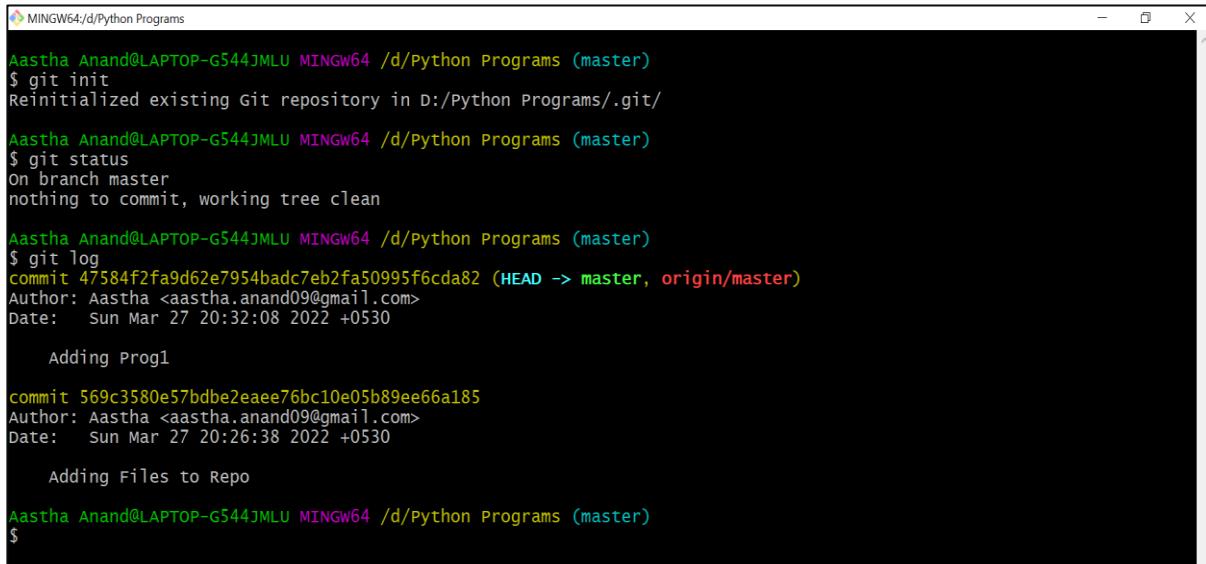

- ls → It gives the file names in the folder.
- ls -lart → Gives the hidden files also.
- git status → Displays the state of the working directory and the staged snapshot.
- touch filename → This command creates a new file in the repository.
- Clear → It clears the terminal.
- rm -rf .git → It removes the repository.
- git log → displays all of the commits in a repository's history
- git diff → It compares my working tree to staging area.

Git status:

```
MINGW64/d/Python Programs
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git init
Reinitialized existing Git repository in D:/Python Programs/.git/
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git status
on branch master
nothing to commit, working tree clean
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$
```

Git log:

```
MINGW64/d/Python Programs
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git init
Reinitialized existing Git repository in D:/Python Programs/.git/
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git status
on branch master
nothing to commit, working tree clean
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git log
commit 47584f2fa9d62e7954badc7eb2fa50995f6cda82 (HEAD -> master, origin/master)
Author: Aastha <aastha.anand09@gmail.com>
Date:   Sun Mar 27 20:32:08 2022 +0530

    Adding Prog1

commit 569c3580e57bdbe2eaee76bc10e05b89ee66a185
Author: Aastha <aastha.anand09@gmail.com>
Date:   Sun Mar 27 20:26:38 2022 +0530

    Adding Files to Repo
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$
```

The git log command displays a record of the commits in a Git repository. By default, the git log command displays a commit hash, the commit message and other commit metadata.

# Experiment 4

**Aim:** Create and visualize branches

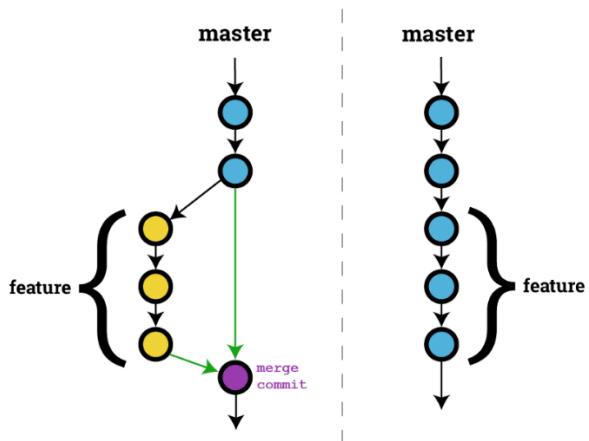

## Theory:

**Branching:** A branch in Git is an independent line of work (a pointer to a specific commit). It allows users to create a branch from the original code (master branch) and isolate their work. Branches allow you to work on different parts of a project without impacting the main branch.

Create branches: The main branch in git is called as master branch. But we can make branches out of this main master branch. All the files present in master can be shown in branch but the file which are created in branch are not shown in master branch. We can also merge both the parent (master) and child (other branches).

Syntax:

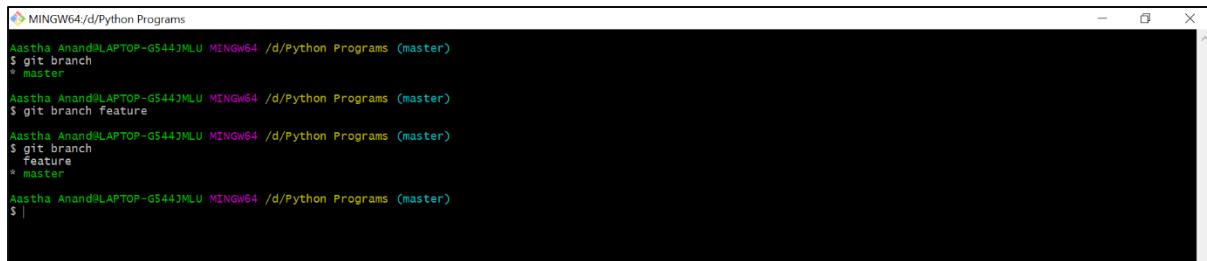

For creating a new branch, git branch name by default is master branch.

## Snapshots –

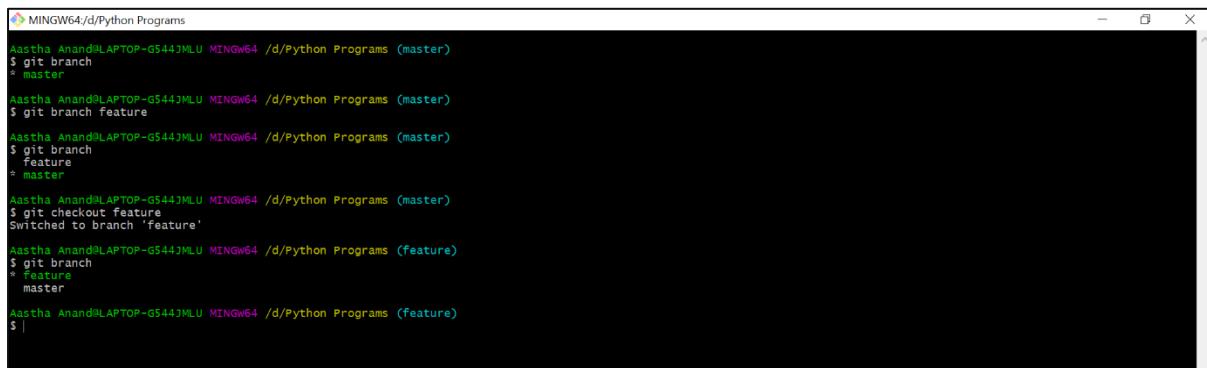

```
MINGW64:/d/Python Programs
astha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
└─ git branch
   └─ master
Astha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
```

## Default branch is master branch

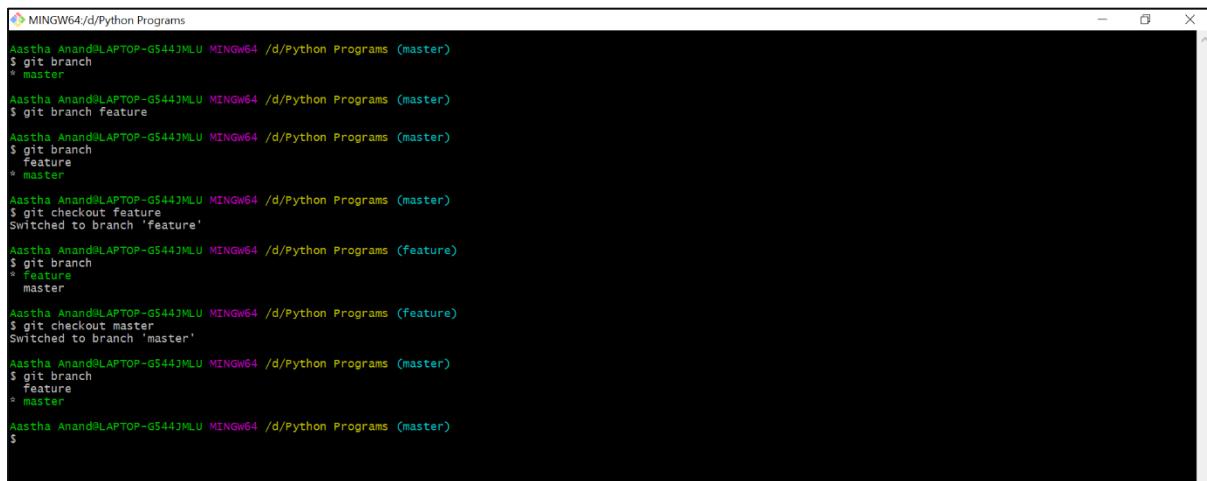

```
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git branch
* master
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git branch feature
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
* master
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ |
```

Adding a feature branch

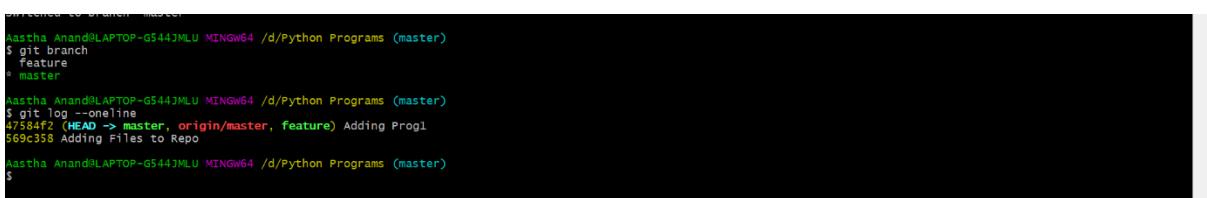

```
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git branch
* master
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git branch feature
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
* master
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git checkout feature
Switched to branch 'feature'
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (feature)
* feature
* master
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (feature)
$ |
```

Switching to feature branch

```
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git branch
* master
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git branch feature
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
* master
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)
$ git checkout feature
Switched to branch 'feature'
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (feature)
* feature
* master
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (feature)
$ git checkout master
Switched to branch 'master'
Aastha Anand@LAPTOP-G544JMLU MINGW64 /d/Python Programs (master)

$ |
```

Checking commits

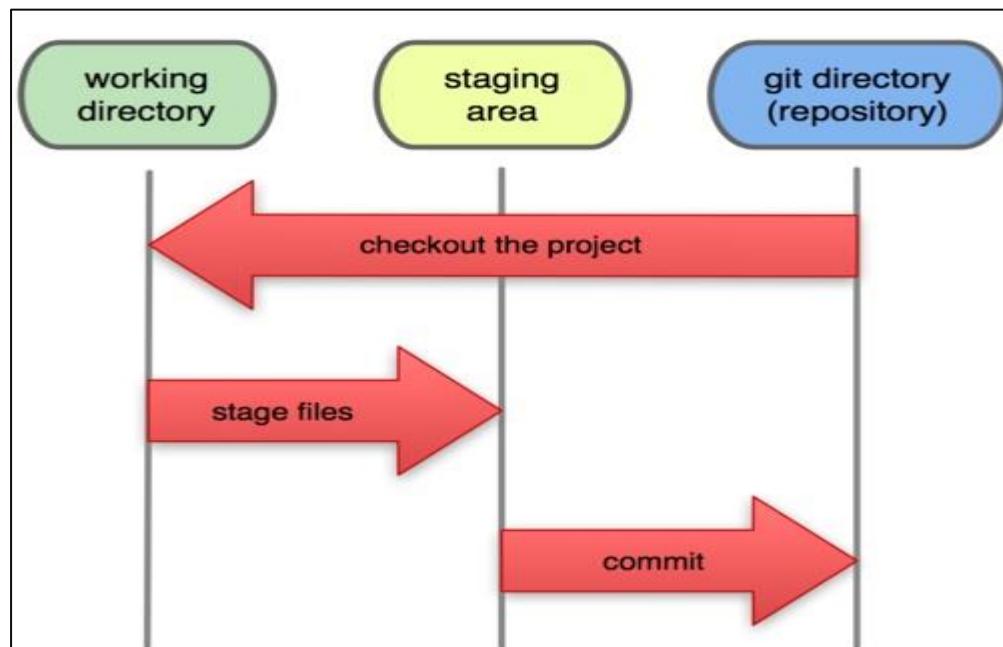

# Experiment 5

**Aim:** Git lifecycle description

## Theory:

Stages in GIT Life Cycle: Files in a Git project have various stages like Creation, Modification, Refactoring, and Deletion and so on. Irrespective of whether this project is tracked by Git or not, these phases are still prevalent. However, when a project is under Git version control system, they are present in three major Git states in addition to these basic ones. Here are the three Git states:

- Working directory
- Staging area
- Git directory (repository)

## Working Directory:

Consider a project residing in your local system. This project may or may not be tracked by Git. In either case, this project directory is called your Working directory.

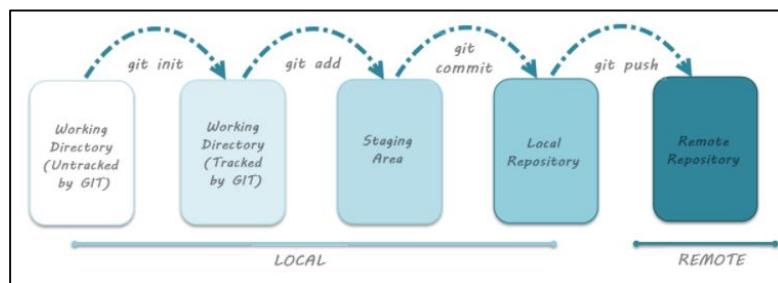

## Staging Area:

Staging area is the playground where you group, add and organize the files to be committed to Git for tracking their versions.

## Git Directory:

Now that the files to be committed are grouped and ready in the staging area, we can commit these files. So, we commit this group of files along with a commit message explaining what is the commit about. Apart from commit message, this step also records the author and time of the commit. Now, a snapshot of the files in the commit is recorded by Git. The information related to this commit is stored in the Git directory.

**Remote Repository:** It means mirror or clone of the local Git repository in GitHub. And pushing means uploading the commits from local Git repository to remote repository hosted in GitHub.

**# Index #**

S. No	Program Title	Page No.
1.	Add collaborators on GitHub Repo	16
2.	Fork and Commit	21
3.	Merge and Resolve conflicts created due to own activity and collaborators activity.	24
4.	Reset and revert	27

## Experiment No. 06

**Aim:** Add collaborators on GitHub Repo

### Theory:

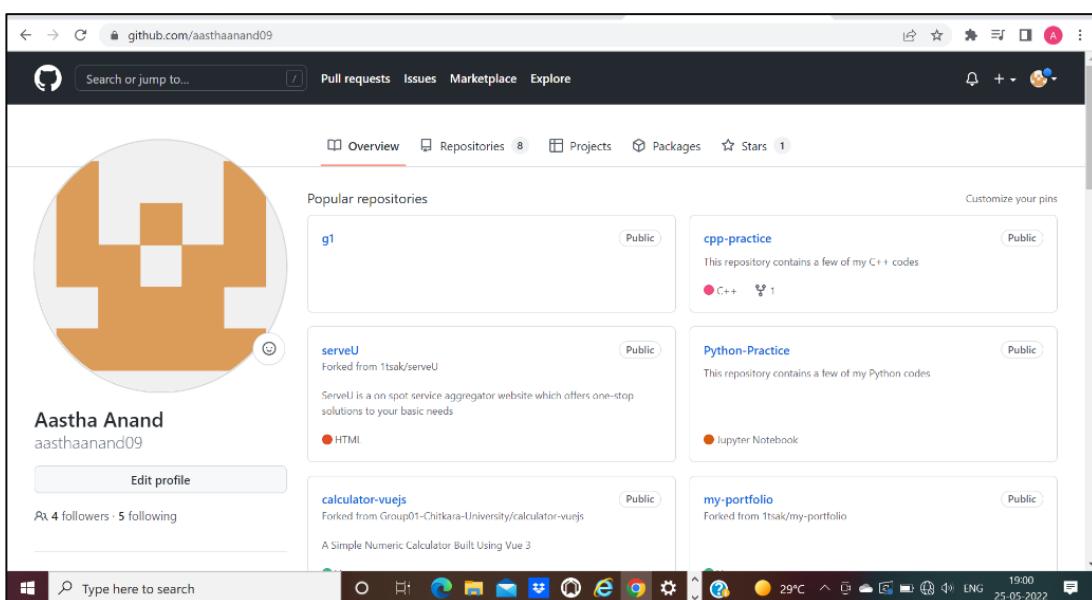

Whenever you make a repository in GitHub, not everyone has the permission to change or push codes into your repository. The users have a read-only access. In order to allow other individuals to make changes to your repository, you need to invite them to collaborate to the project.

GitHub also restricts the number of collaborators we can invite within a period of 24 hours. If we exceed the limit, then either we have to wait for 24-hours or we can also create an organization to collaborate with more people.

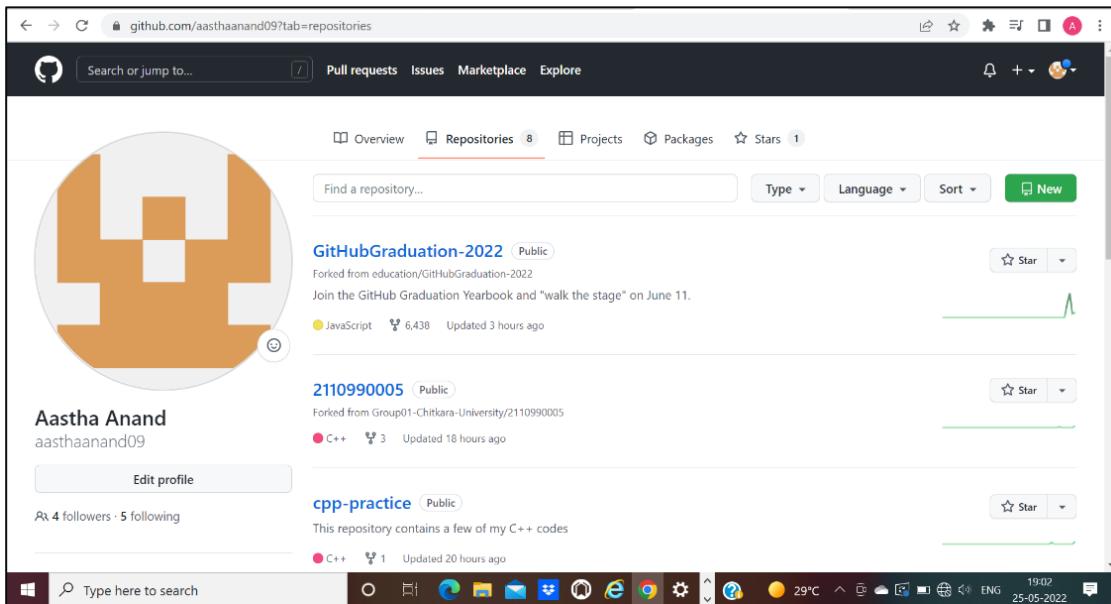

Being a collaborator, the user can create, merge and close pull requests in the repository. They can also remove them as the collaborator.

### Procedure:

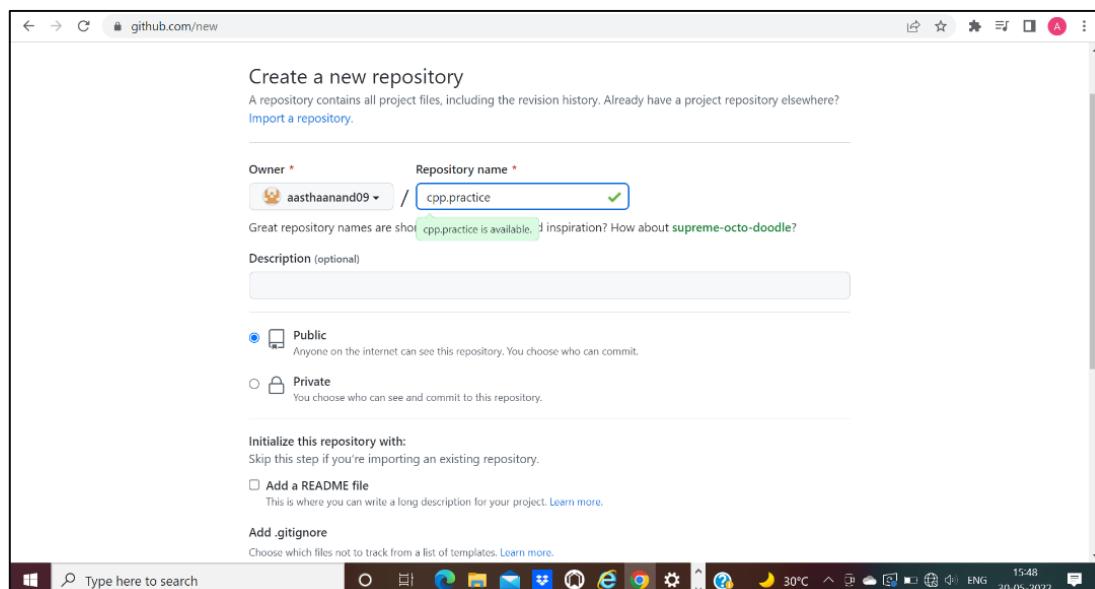

1. Login to your GitHub account and you will land on the homepage as shown below. Click on Repositories option in the menu bar.

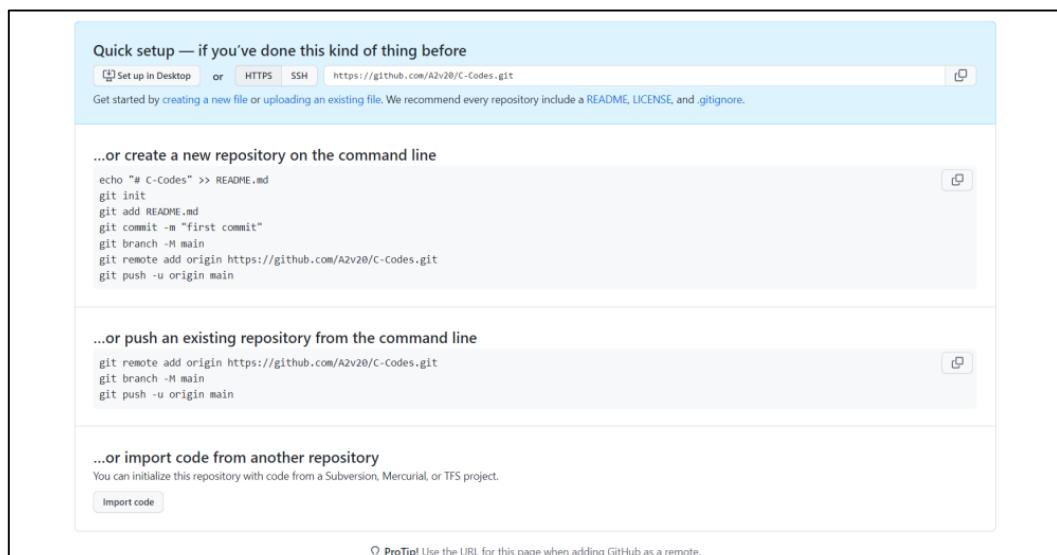

2. Click on the ‘New’ button in the top right corner.

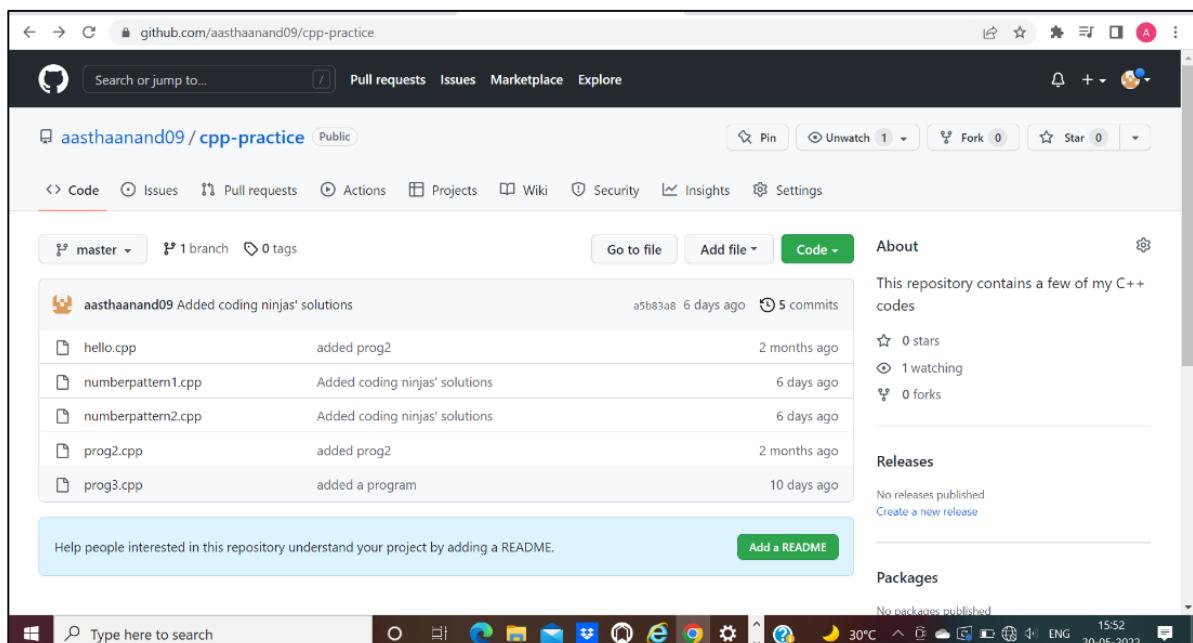

3. Enter the Repository name and add the description of the repository.
4. Select if you want the repository to be public or private.

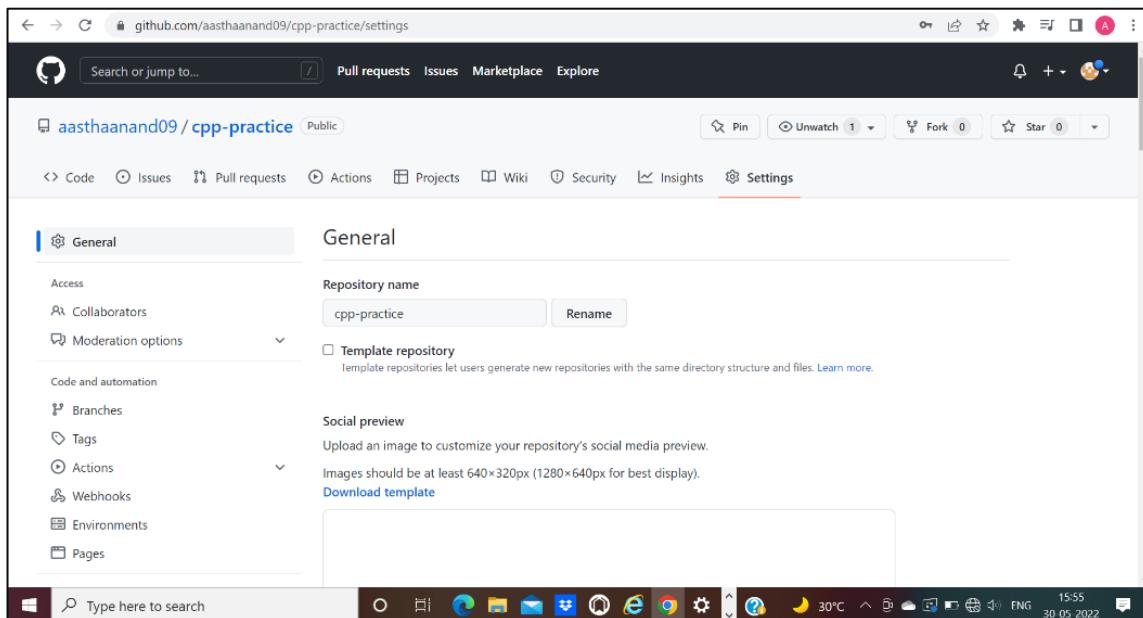

5. If you want to import code from an existing repository select the import code option.

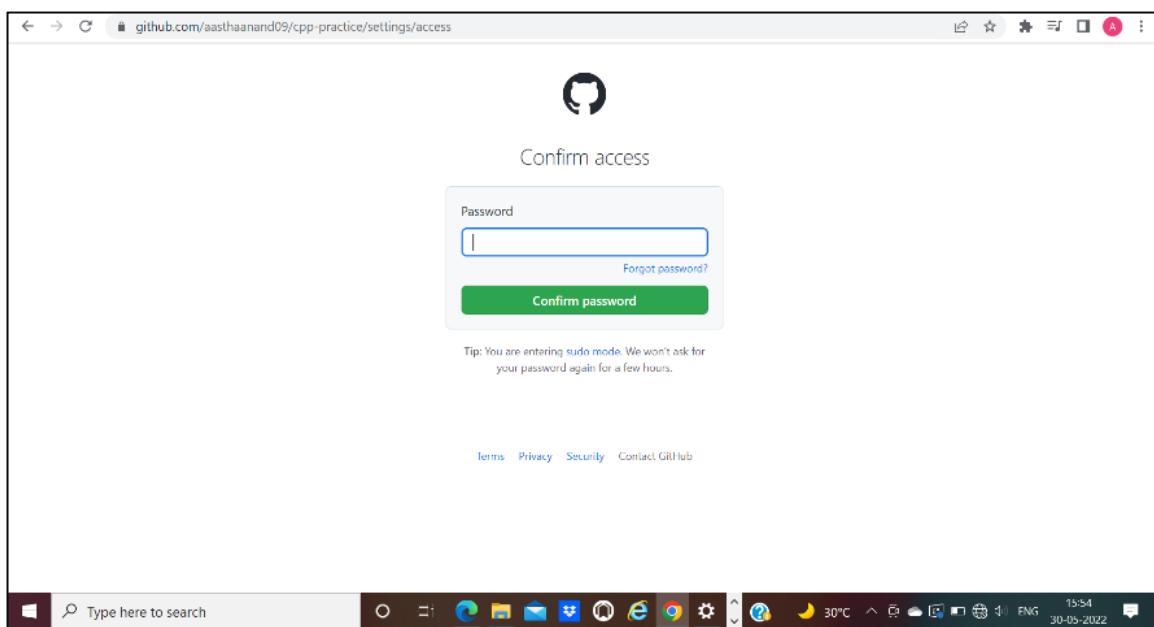

6. Now, you have created your repository successfully.
7. To add collaborators to your repository, open your repository and select settings option in the navigation bar.

8. Click on Collaborators option under the access tab.

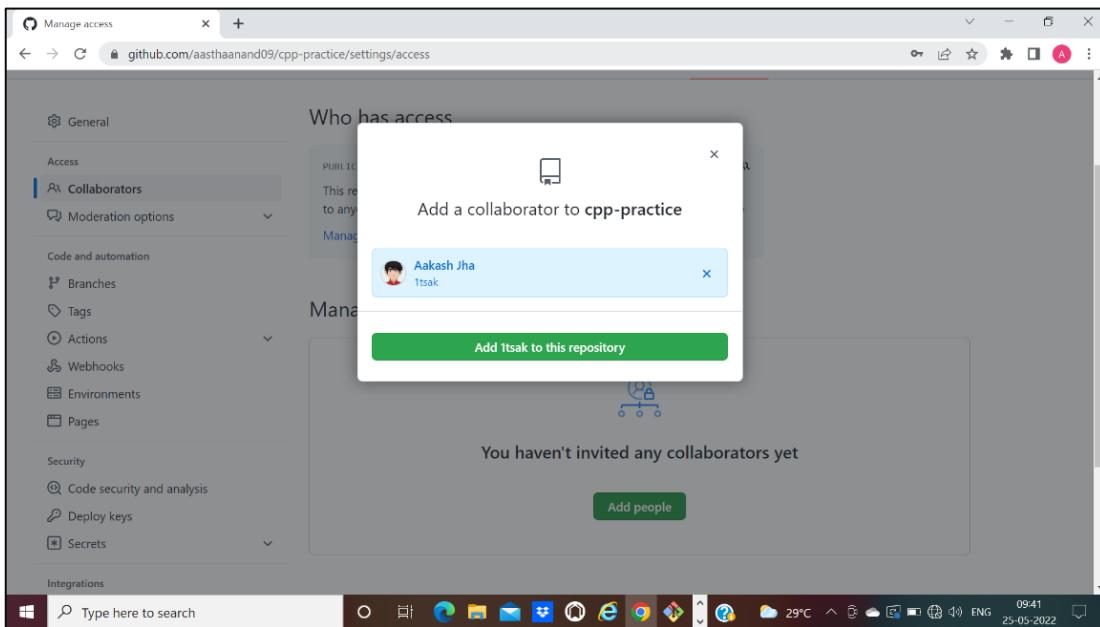

9. After clicking on collaborators, GitHub asks you to enter your password to confirm the access to the repository.

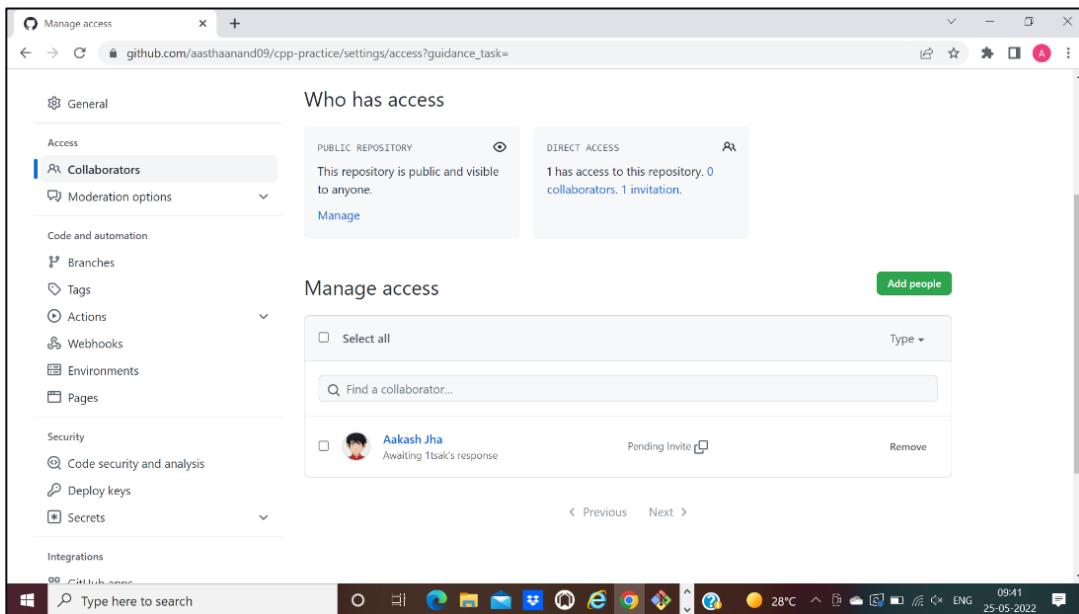

10. After entering the password, you can manage access and add/remove team members to your project.

11. To add members, click on the add people option and search the id of your respective team member.

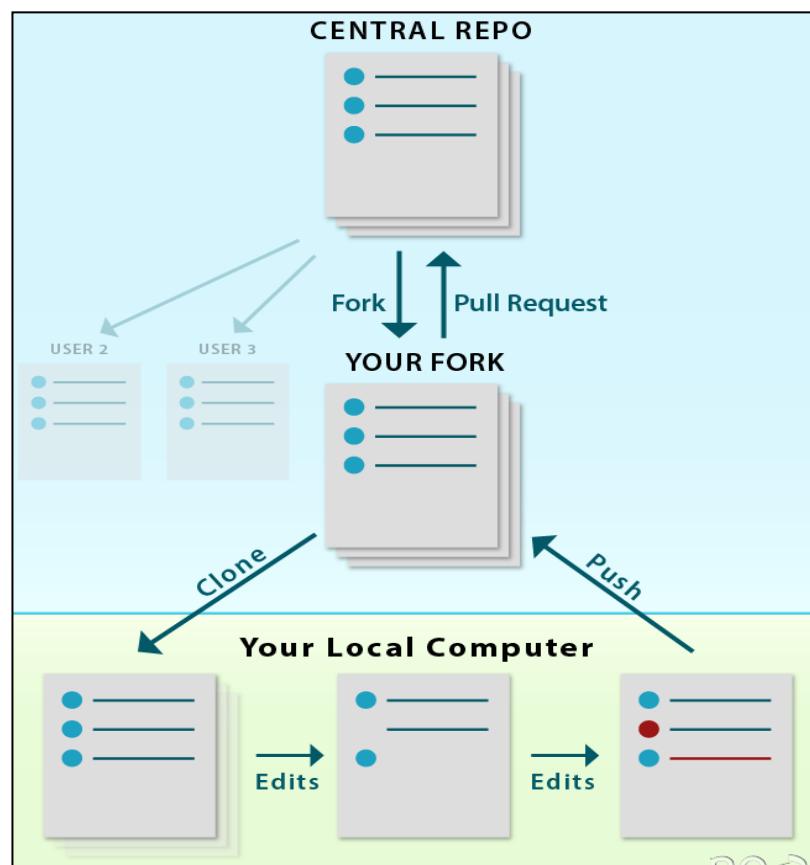

12. To remove any member, click on remove option available in the last column of member's respective row.

## Experiment No. 07

### Aim: Fork and Commit

**Theory:** A fork is a copy of a repository that you manage. It allows us to freely experiment with the data. After creating a fork, we can make any desired change like adding collaborators, rename files, generate GitHub pages but all these changes won't be reflected in the original repository.

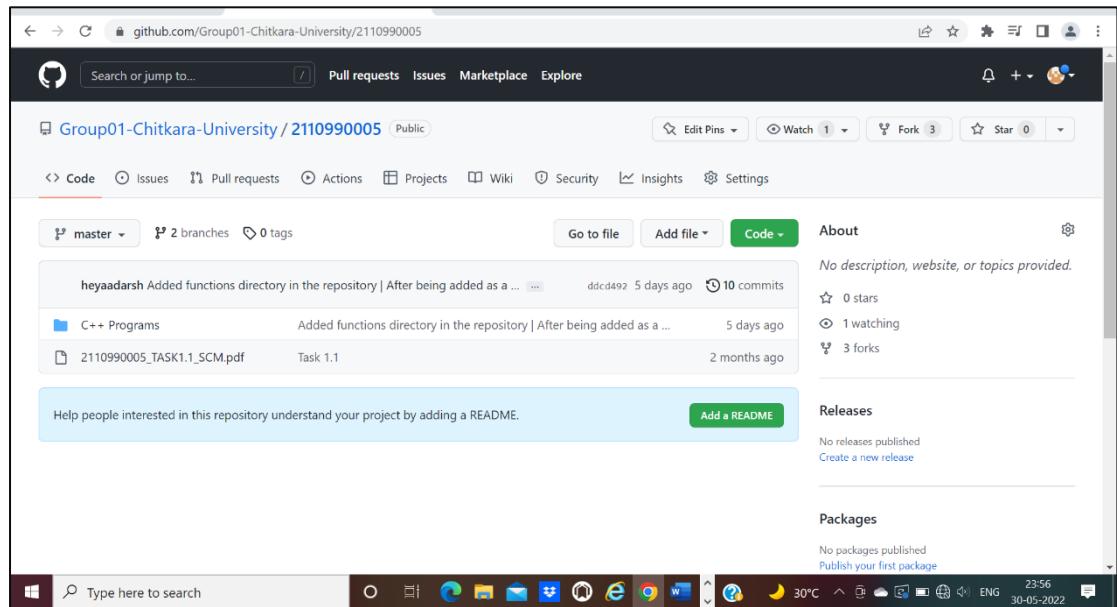

reference for picture: <https://www.earthdatascience.org>

To import the changes into the original repository, the user needs to send a pull request to the maintainer. If the maintainer closes the pull request only then the content can be added to the original repository.

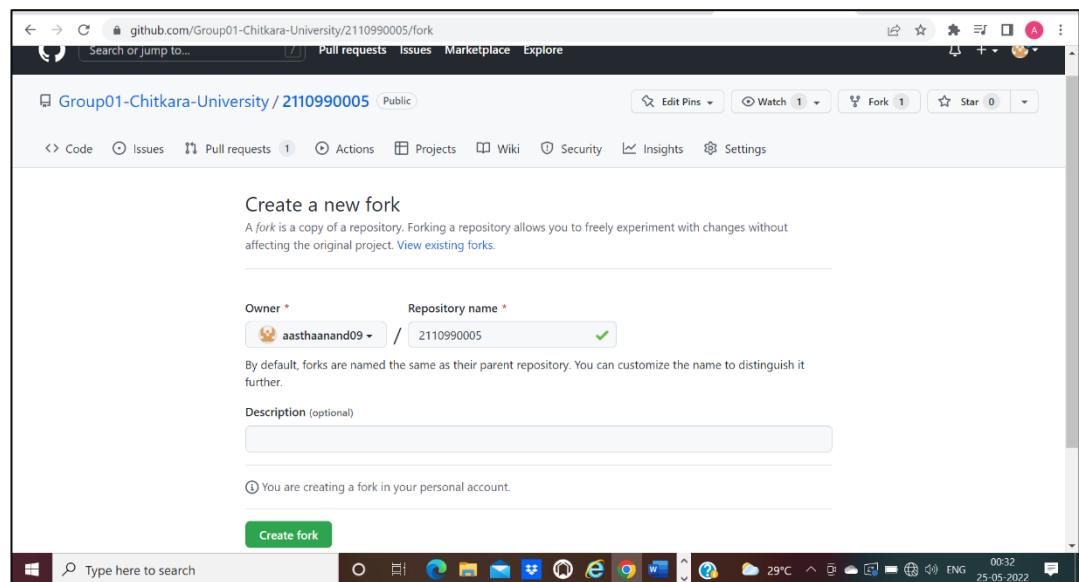

Forking is a better method than directly cloning any repository, as in cloning only the default branch is cloned whereas forking creates a clone of the complete repo and also allows us to push the changes to the main repository by using open and close pull request.

## Procedure:

1. To fork a repository first thing you need to do is, sign in to your GitHub account and then you come to the repository you want to fork, so here for demo purpose am using **Group01-Chitkara-University/2110990005** repository.

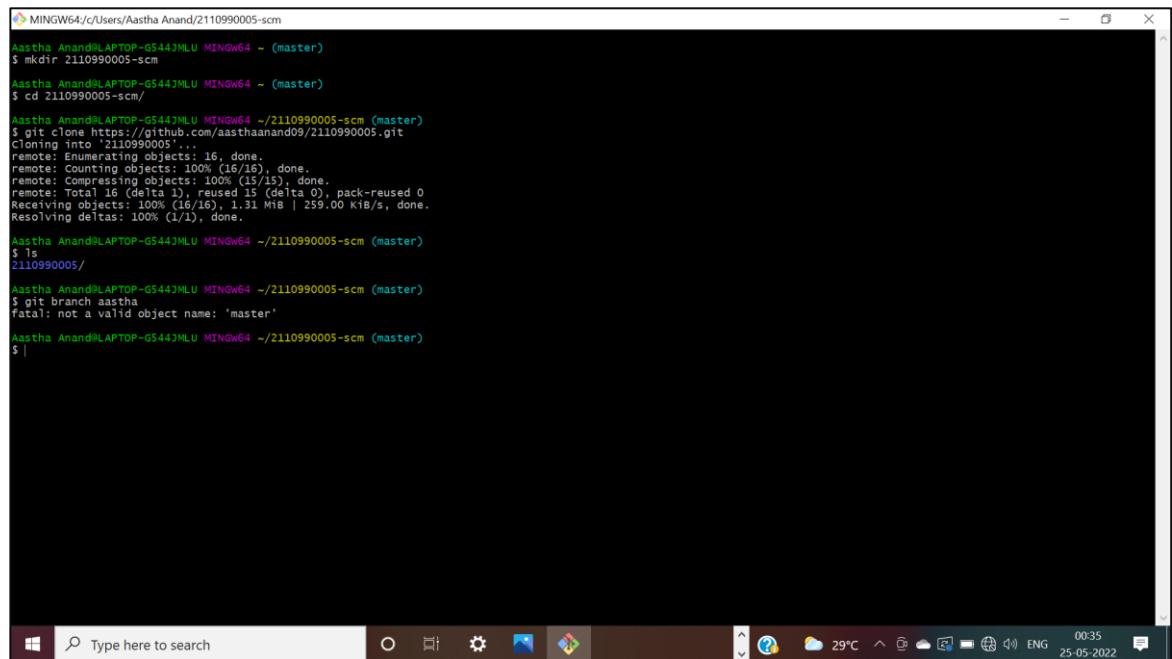

2. Click on the **Fork** button on right upside corner. Then it will ask to create a new fork, add description if you want and then click on create fork.

3. Now you will have a copy of the repo you have forked from other user. Now you can do any modification you want without making changes to main source code.

4. Now type git clone <https://github.com/Group01-Chitkara-University/2110990005.git> on git.

Git clone <url> --> This command is used to fetch the remote repo or to clone the repo.

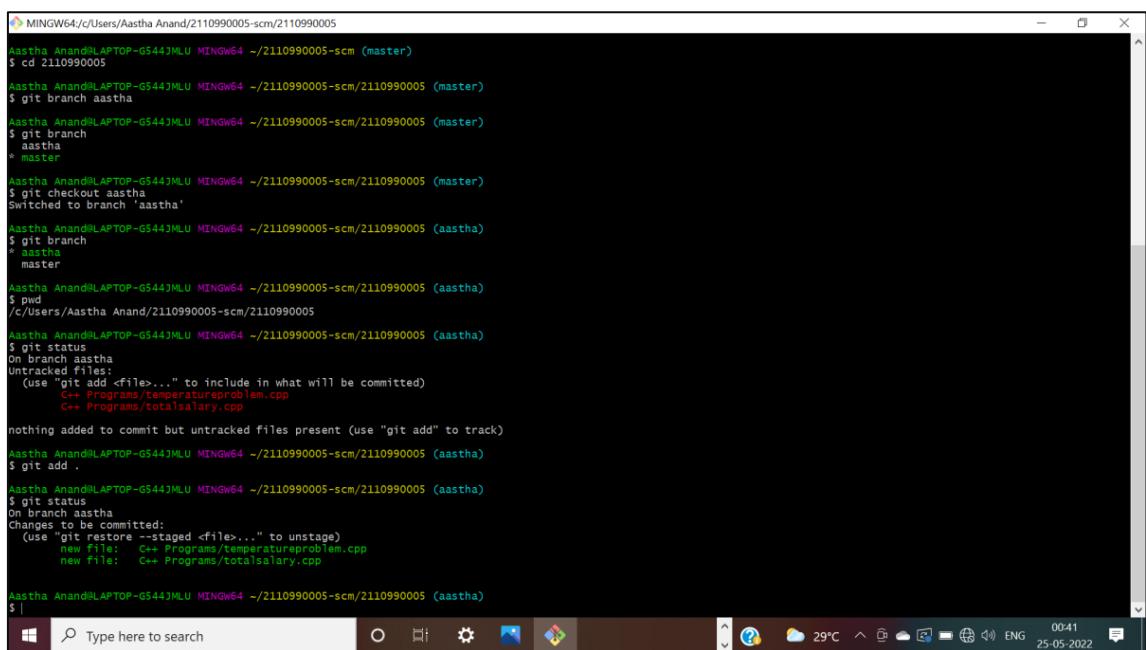

```
MINGW64:/c/Users/Aastha Anand/2110990005-scm
Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~ (master)
$ mkdir 2110990005-scm
Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~ (master)
$ cd 2110990005-scm/
Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~/2110990005-scm (master)
$ git clone https://github.com/aasthaanand09/2110990005.git
Cloning into '2110990005'...
remote: Enumerating objects: 16, done.
remote: Counting objects: 100% (16/16), done.
remote: Compressing objects: 100% (15/15), done.
remote: Total 16 (delta 0), pack-reused 0
Resolving deltas: 100% (16/16), done.
Resolving deltas: 100% (1/1), done.

Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~/2110990005-scm (master)
$ ls
2110990005/
Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~/2110990005-scm (master)

    new file:   C++ Programs/temperatureproblem.cpp
    new file:   C++ Programs/totalssalary.cpp

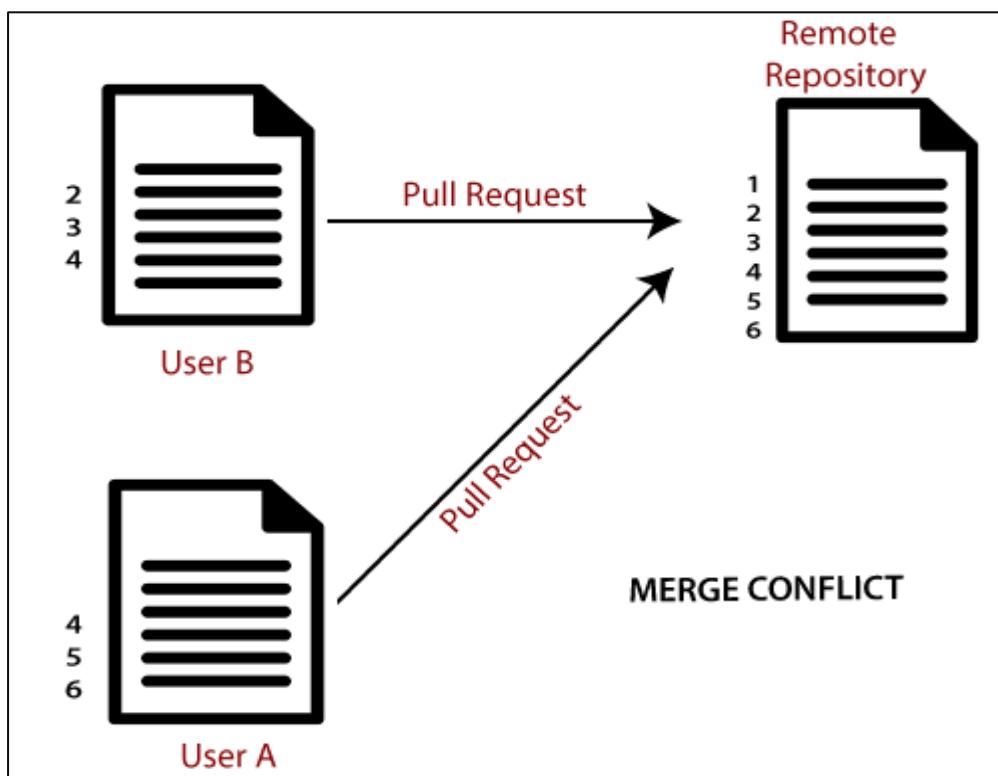

Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~/2110990005-scm/2110990005 (aastha)
$ |
```

## **Experiment No. 08**

**Aim:** Merge and Resolve conflicts created due to own activity and collaborators activity.

### **Theory:**

Version control systems are all about managing contributions between multiple distributed authors (usually developers). Sometimes multiple developers may try to edit the same content. If Developer A tries to edit code that Developer B is editing a conflict may occur.

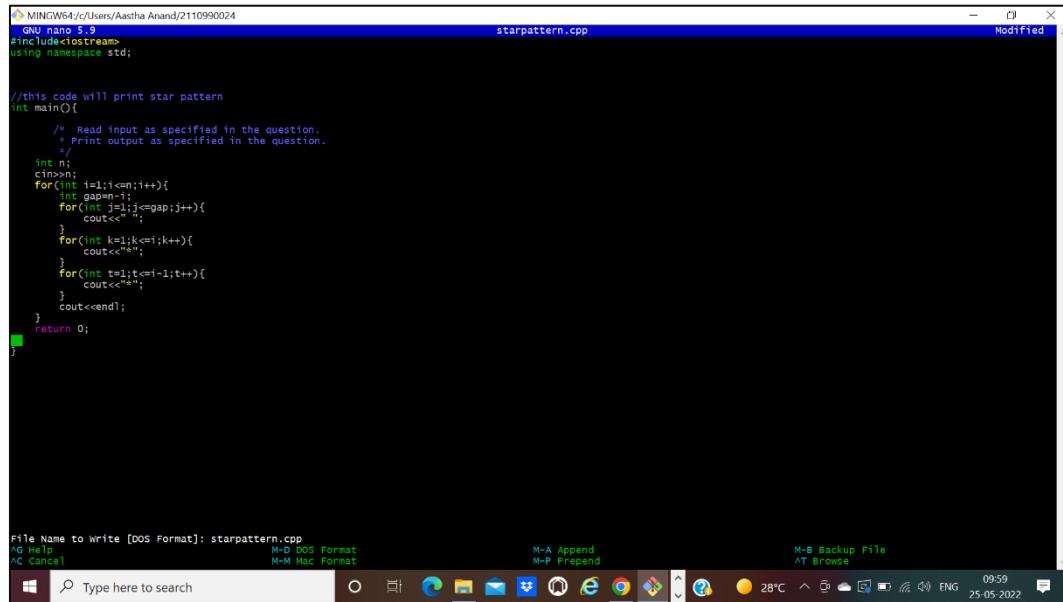

reference for picture: <https://www.javatpoint.com/git-merge-and-merge-conflict>

If you have a merge conflict on the command line, you cannot push your local changes to GitHub until you resolve the merge conflict locally on your computer.

To alleviate the occurrence of conflicts developers will work in separate isolated branches. If a merge conflict still arises between the compare branch and base branch in your pull request, you can view a list of the files with conflicting changes above the Merge pull request button. The Merge pull request button is deactivated until you've resolved all conflicts between the compare branch and base branch.

## Procedure:

- 1) Do changes in master branch and commit those change. And checkout to different branch and again do changes and commit it. Now checkout to master branch and merge that branch in master.

The screenshot shows a Windows desktop environment. In the center is a terminal window titled "MINGW64/c/Users/Aastha Anand/2110990024". The terminal displays the following C++ code:

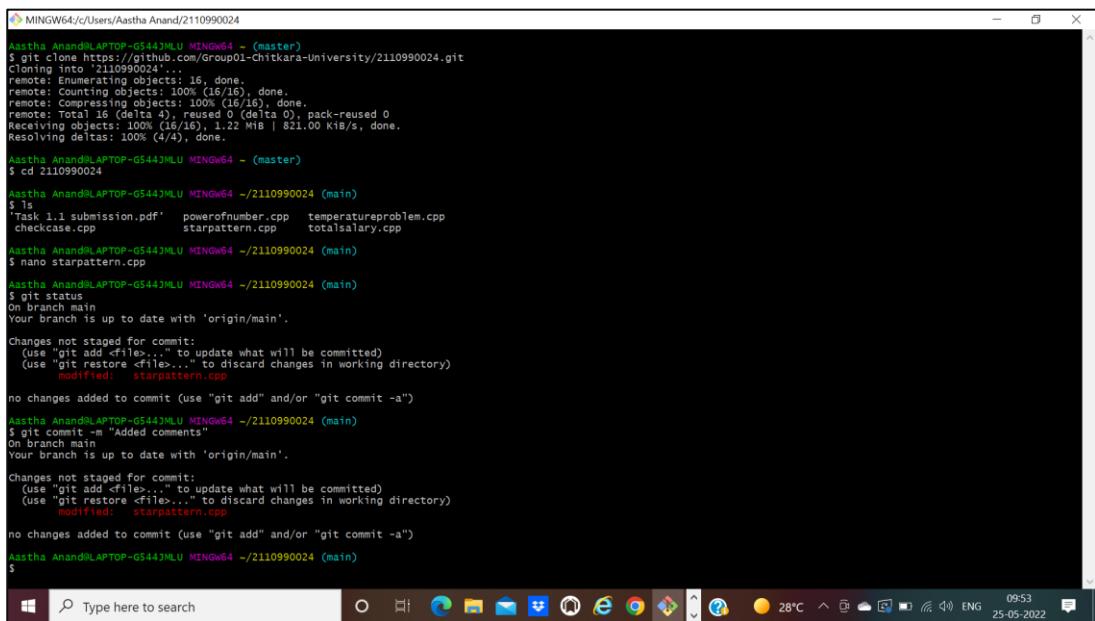

```
GNU nano 5.9
#include<iostream>
using namespace std;

//this code will print star pattern
int main(){
    /* Read input as specified in the question.
     * Print output as specified in the question.

    int n;
    cin>>n;
    for(int i=1;i<=n;i++){
        int gap=n-i;
        for(int j=1;j<=gap;j++){
            cout<<" ";
        }
        for(int k=i;k<=i;k++){
            cout<<"*";
        }
        for(int t=1;t<=i-1;t++){
            cout<<"*";
        }
        cout<<\n;
    }
    return 0;
}
```

Below the terminal, the taskbar shows various icons for applications like File Explorer, Edge, and File Manager. The system tray indicates the date as 25-05-2022 and the time as 09:59.

2. Now try to merge it will give Conflicts Error.

The screenshot shows a Windows desktop environment. In the center is a terminal window titled "MINGW64/c/Users/Aastha Anand/2110990024". The terminal displays the following git log and status output:

```
Aastha Anand@LAPTOP-G544JMLU MINGW64 - (master)
$ git clone https://github.com/Group01-Chitkara-University/2110990024.git
Cloning into '2110990024'...
remote: Enumerating objects: 16, done.
remote: Counting objects: 100% (16/16), done.
remote: Compressing objects: 100% (16/16), done.
remote: Total 16 (delta 4), reused 0 (delta 0), pack-reused 0
Receiving objects: 100% (16/16), 1.22 MiB | 821.00 KiB/s, done.
Resolving deltas: 100% (4/4), done.

Aastha Anand@LAPTOP-G544JMLU MINGW64 - (master)
$ cd 2110990024
Aastha Anand@LAPTOP-G544JMLU MINGW64 -/2110990024 (main)
$ ls
Task 1.1 submission.pdf  powerofnumber.cpp  temperatureproblem.cpp
checkcase.cpp  starpattern.cpp  totalsalary.cpp
Aastha Anand@LAPTOP-G544JMLU MINGW64 -/2110990024 (main)
$ nano starpattern.cpp

Aastha Anand@LAPTOP-G544JMLU MINGW64 -/2110990024 (main)
$ git status
On branch main
Your branch is up to date with 'origin/main'.

Changes not staged for commit:
  (use "git add <file>..." to update what will be committed)
  (use "git restore <file>..." to discard changes in working directory)
        modified:   starpattern.cpp

no changes added to commit (use "git add" and/or "git commit -a")

Aastha Anand@LAPTOP-G544JMLU MINGW64 -/2110990024 (main)
$ git commit -m "Added comments"
On branch main
Your branch is up to date with 'origin/main'.

Changes not staged for commit:
  (use "git add <file>..." to update what will be committed)
  (use "git restore <file>..." to discard changes in working directory)
        modified:   starpattern.cpp

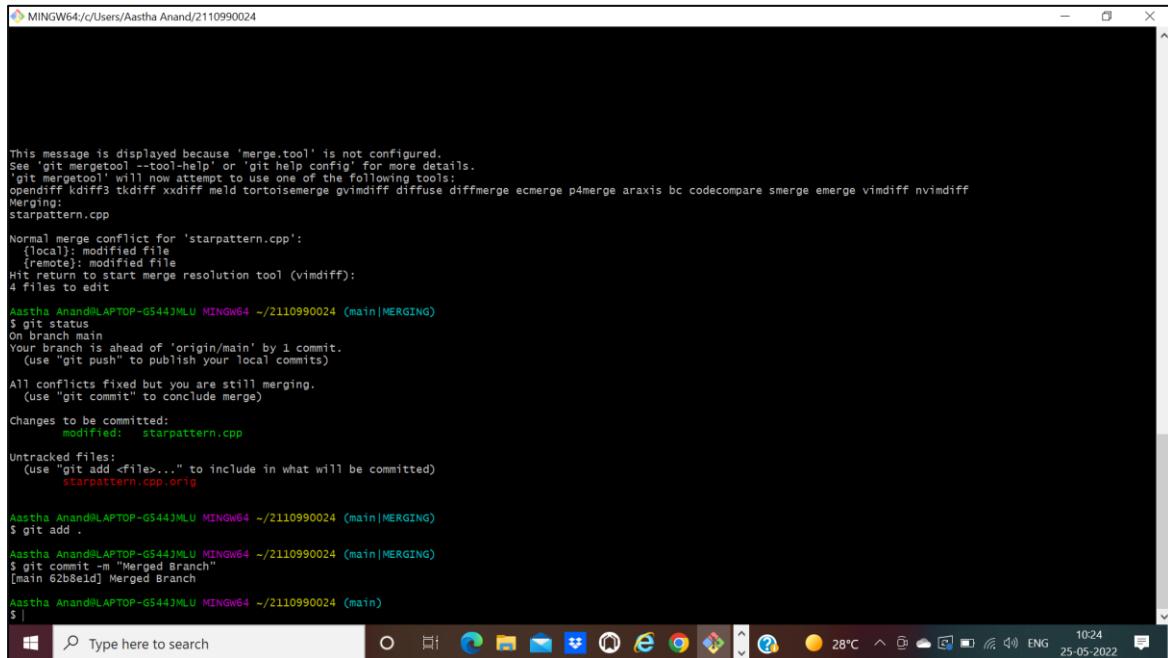

no changes added to commit (use "git add" and/or "git commit -a")

Aastha Anand@LAPTOP-G544JMLU MINGW64 -/2110990024 (main)
$
```

Below the terminal, the taskbar shows various icons for applications like File Explorer, Edge, and File Manager. The system tray indicates the date as 25-05-2022 and the time as 09:53.

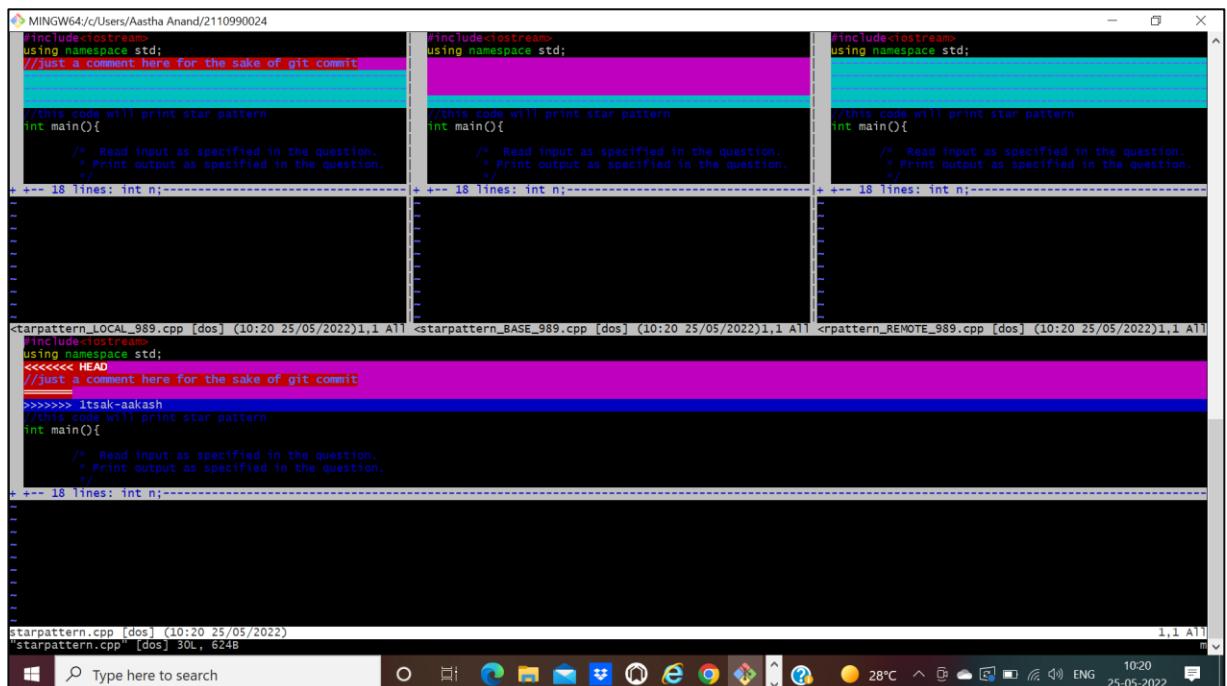

### 3. Use Command “git mergetool” to solve the conflict.

**git -mergetool** – Run merge conflict resolution tools to resolve merge conflicts.

```
This message is displayed because 'merge.tool' is not configured.  
See 'git mergetool --tool-help' or 'git help config' for more details.  
'git mergetool' will now attempt to use one of the following tools:  
opendiff kdiff3 tkdiff xxdiff meld tortoisemerge gvimdiff diffuse diffmerge ecmerge p4merge araxis bc codecompare smerge emerge vimdiff nvimdiff  
Merge tools:  
starpattern.cpp  
  
Normal merge conflict for 'starpattern.cpp':  
  {local}: modified file  
  {remote}: modified file  
Hit return to start merge resolution tool (vimdiff):  
4 files to edit  
  
Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~/2110990024 (main|MERGING)  
$ git status  
On branch main  
Your branch is ahead of 'origin/main' by 1 commit.  
  (use "git push" to publish your local commits)  
  
All conflicts fixed but you are still merging.  
(use "git commit" to conclude merge)  
  
Changes to be committed:  
  modified: starpattern.cpp  
  
Untracked files:  
  (use "git add <file>..." to include in what will be committed)  
    starpattern.cpp.orig  
  
Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~/2110990024 (main|MERGING)  
$ git add .  
Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~/2110990024 (main|MERGING)  
$ git commit -m "Merged Branch"  
[main 62b8e1d] Merged Branch  
Aastha Anand@LAPTOP-GS44JMLU MINGW64 ~/2110990024 (main)  
$ |
```

### 4. Press “I” to insert, after insertion. Press “:wq”. The merge conflict is solved and aastha branch is merged to master branch.

```
#include<iostream>  
using namespace std;  
//just a comment here for the sake of git commit  
  
//this code will print star pattern  
int main(){  
    /* Read input as specified in the question.  
     * Print output as specified in the question.  
     */  
+ --- 18 lines: int n;-----  
  
    cout << "Enter the number of rows: " << endl;  
    cin >> n;  
  
    for (int i = 1; i <= n; i++) {  
        for (int j = 1; j <= i; j++) {  
            cout << "*";

## Experiment No. 09

### Aim: Reset and Revert

### Theory:

Git-revert – Revert some existing commits.

A reset is an operation that takes a specified commit and resets the "three trees" to match the state of the repository at that specified commit. A reset can be invoked in three different modes which correspond to the three trees. In reset, rest of the commits wash out after the mentioned commit. This is a limitation of reset command that we cannot have any random access.

A revert is an operation that takes a specified commit and creates a new commit which inverses the specified commit. git revert can only be run at a commit level scope and has no file level functionality.

These two features justify the Version- controlled feature of the git as we can rollback to any version at any time.

### PROCEDURE:

Firstly, prepare a log of multiple commits to make the reset and revert command function.

**Reset:** **reset** is the command we use when we want to move the repository back to a previous **commit**, discarding any changes made after that **commit**.

- 1) Create few files, stage them and commit.
- 2) Check the git log

```
MINGW64:/c/Users/Aastha Anand/2110990024 (main)
$ git log --oneline
62b8e1d (HEAD -> main) Merged Branch
911d834 Another One
481ccdd (itsak-aakash) Another set of changes
da941a6 (origin/main, origin/HEAD) Added another comment
ed66e51 Changes
e959a68 Added comments
9c1bd66 Add files via upload
b1ee9c5 Loops in C++
11319c9 Conditionals and Loops solution
3331e50 Conditionals and Loops solution
973a017 Task 1.1
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990024 (main)
$
```

- 3) Pick any commit where you want the repository to rollback. Copy its checksum and paste it in the **\$ git reset checksum** command.

```
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990024 (main)
$ git log --oneline
62b8e1d (HEAD -> main) Merged Branch
911d834 Another One
481cd5 (itsak-aakash) Another set of changes
da941a6 (origin/main, origin/HEAD) Added another comment
ed66e51 Changes
e959a68 Added comments
9c1bd66 Add files via upload

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990024 (main)
$ git reset --hard
HEAD is now at ed66e51 Changes

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990024 (main)
$ |
```

## Revert:

Follow these steps to revert any change:

- 1) Pick the change where you want the project to revert back.  
Copy its checksum and paste it in the revert command.

```
MINGW64:/c/Users/Aastha Anand/2110990024

## Introduction

### What is GIT and why is it used?

Git is a version control system that is widely used in the programming world. It is used for tracking changes in the source code during software development. It was developed in 2005 by Linus Torvalds, the creator of the Linux operating system kernel.

Git is a speedy and efficient distributed [VCS](#) tool that can handle projects of any size, from small to very large ones. Git provides cheap local branching, convenient staging areas, and multiple workflows. It is free, open-source software that lowers the cost because developers can use Git without paying money. It provides support for non-linear development. Git enables multiple developers or teams to work separately without having an impact on the work of others.

Git is an example of a distributed version control system (DVCS) (hence Distributed Version Control System).

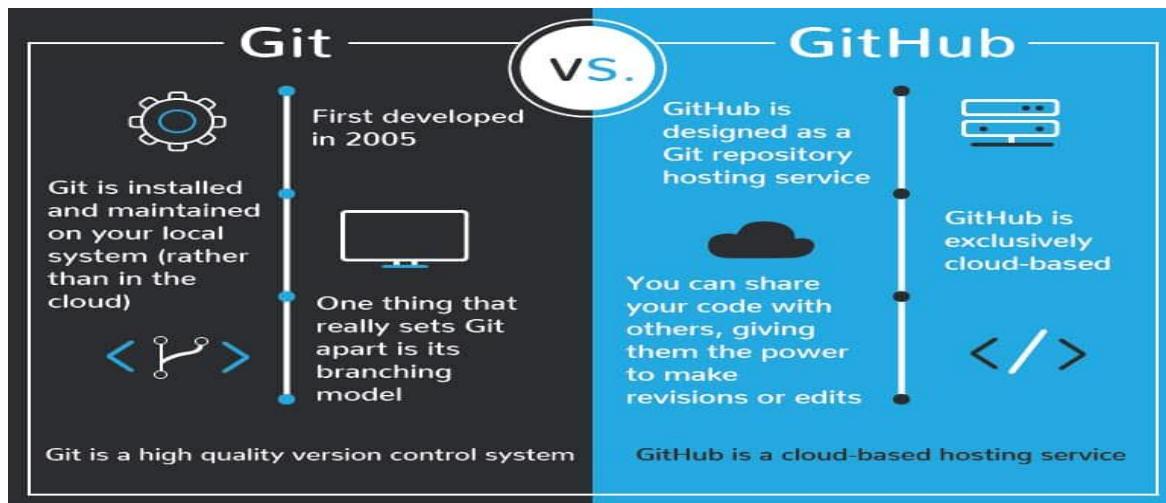

### What is GITHUB?

It is the world's largest open-source software developer community platform where the users upload their projects using the software Git.

### What is the difference between GIT and GITHUB?

## What is Repository?

A repository is a directory or storage space where your projects can live. Sometimes GitHub users shorten this to “repo.” It can be local to a folder on your computer, or it can be a storage space on GitHub or another online host. You can keep code files, text files, image files, you name it, inside a repository.

## What is Version Control System (VCS)?

A version control system is a tool that helps you manage “versions” of your code or changes to your code while working with a team over remote distances. Version control keeps track of every modification in a special kind of database that is accessible to the version control software. Version control software (VCS) helps you revert back to an older version just in case a bug or issue is introduced to the system or fixing a mistake without disrupting the work of other team members.

## Types of VCS

1. Local Version Control System
  2. Centralized Version Control System
  3. Distributed Version Control System
- I. **Local Version Control System:** Local Version Control System is located in your local machine. If the local machine crashes, it would not be possible to retrieve the files, and all the information will be lost. If anything happens to a single version, all the versions made after that will be lost.
- AI. **Centralized Version Control System:** In the Centralized Version Control Systems, there will be a single central server that contains all the files related to the project, and many collaborators checkout files from this single server (you will only have a working copy). The problem with the Centralized

Version Control Systems is if the central server crashes, almost everything related to the project will be lost.

- BI. **Distributed Version Control System:** In a distributed version control system, there will be one or more servers and many collaborators similar to the centralized system. But the difference is, not only do they check out the latest version, but each collaborator will have an exact copy of the main repository on their local machines. Each user has their own repository and a working copy. This is very useful because even if the server crashes we would not lose everything as several copies are residing in several other computers.
-

## **Problem Statement**

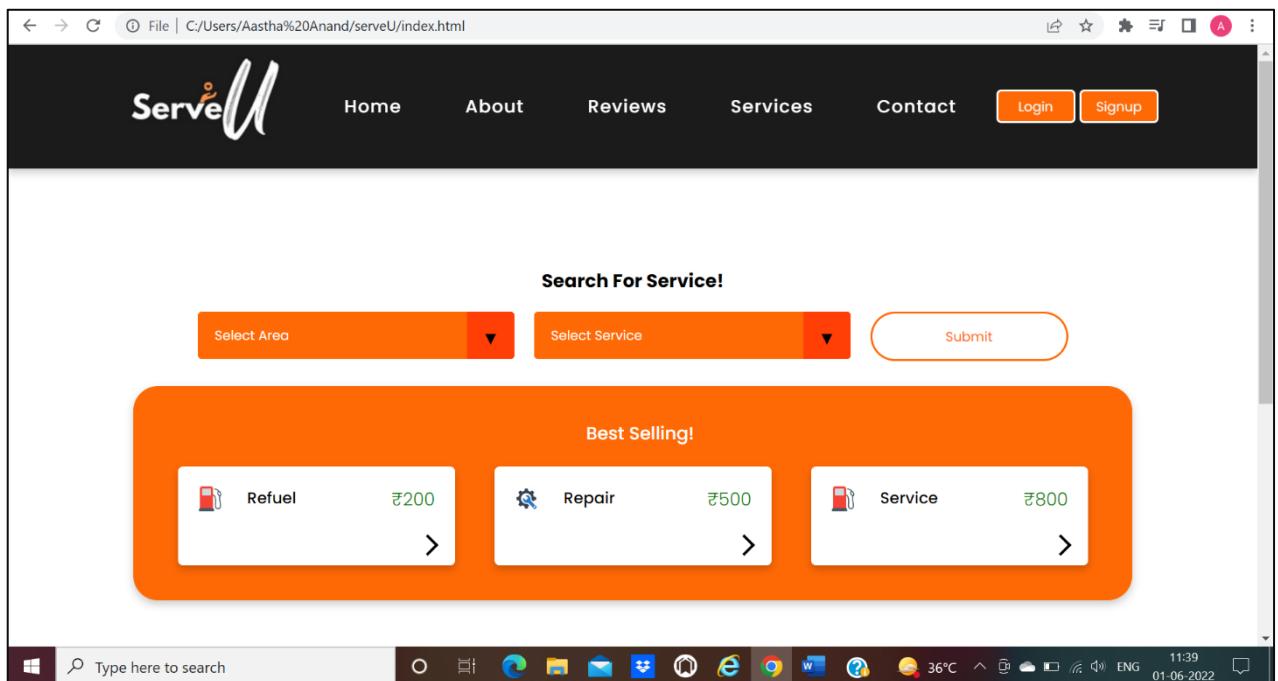

“Build a website and deploy it on GitHub”

Many a times, while travelling we get into certain unforeseen situations where we run out of fuel or our vehicle gets overheated. On a deserted road, the possibility of finding a petrol pump nearby or a mechanic is negligible. In a situation like this we would need someone to provide assistance to help us get out of that situation. Here comes "ServeU" addressing the real time vehicle breakdown problems of customers in day-to-day life.

## Solution

Vehicle Servicing, Vehicle repairs and Car cleaning - we are your one-stop solution for all things cars. ServeU intends to be the best roadside assistance provider in India by addressing the real time vehicle breakdown problems of customers in day-to-day life. A brainchild of 5 friends - Aadarsh Kumar, Aakash Jha, Aastha Anand, Aayushi Jain and Abhimanyu Nain, ServeU is a network of technology-enabled automobile service centres, offering a seamless car and bike service experience at the convenience of a tap. With our highly skilled technicians, manufacturer recommended procedures and the promise of genuine spare parts we are your best bet. Stay in the comforts of your home or office and make the most of our complimentary pick-up and drop-in service. Count on us to be your personal vehicle care expert, advisor and mechanic.

## **Objective:**

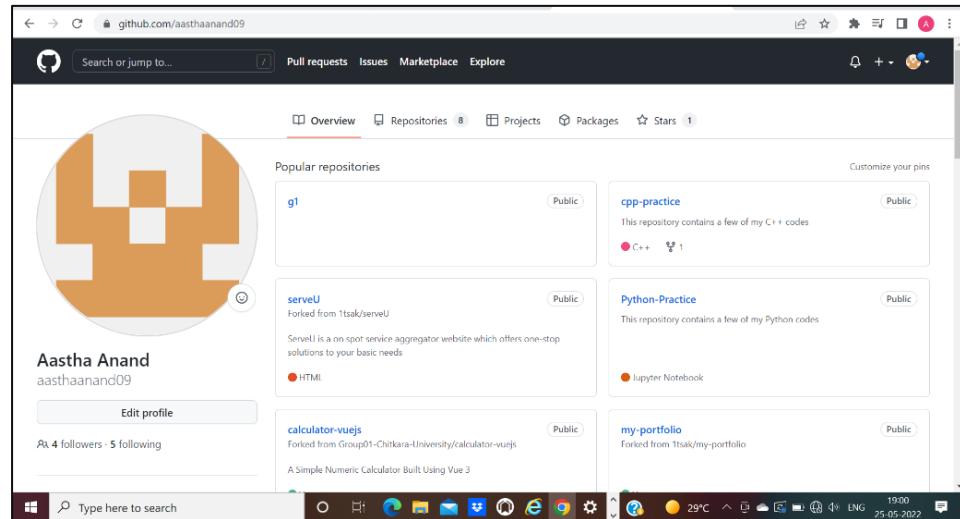

The objective of this project is to associate programming with git because:

1. This is required because the collaboration makes the team work easy.
  2. The code becomes manageable and we can build a clean repository.
  3. Tracking and resolving of the errors is quite feasible in this process.
  4. Moreover, we can make our locally available projects, globally available.
-

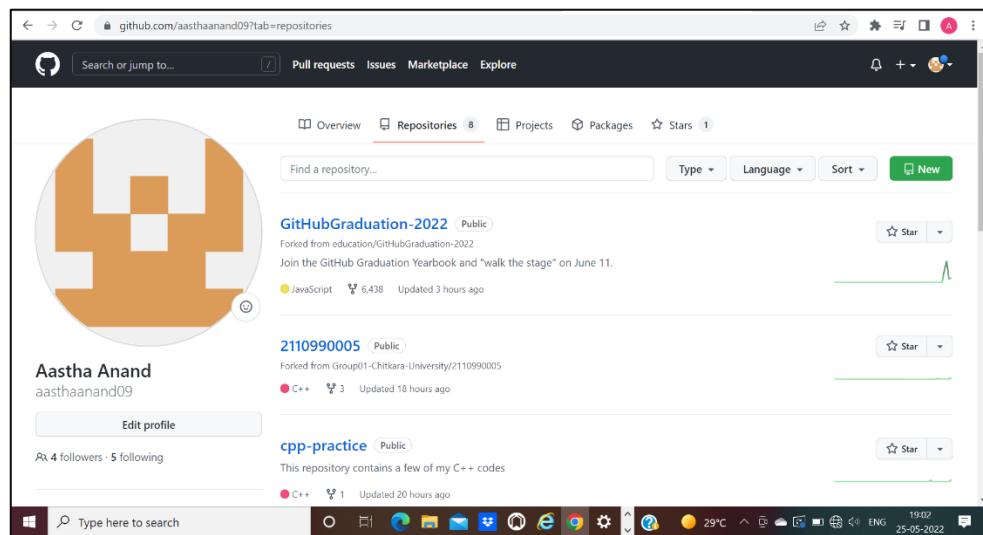

## Experiment No. 01

Aim: Create a distributed Repository and add members in project team

- 1) Login to your GitHub account and you will land on the homepage as shown below. Click on Repositories option in the menu bar.

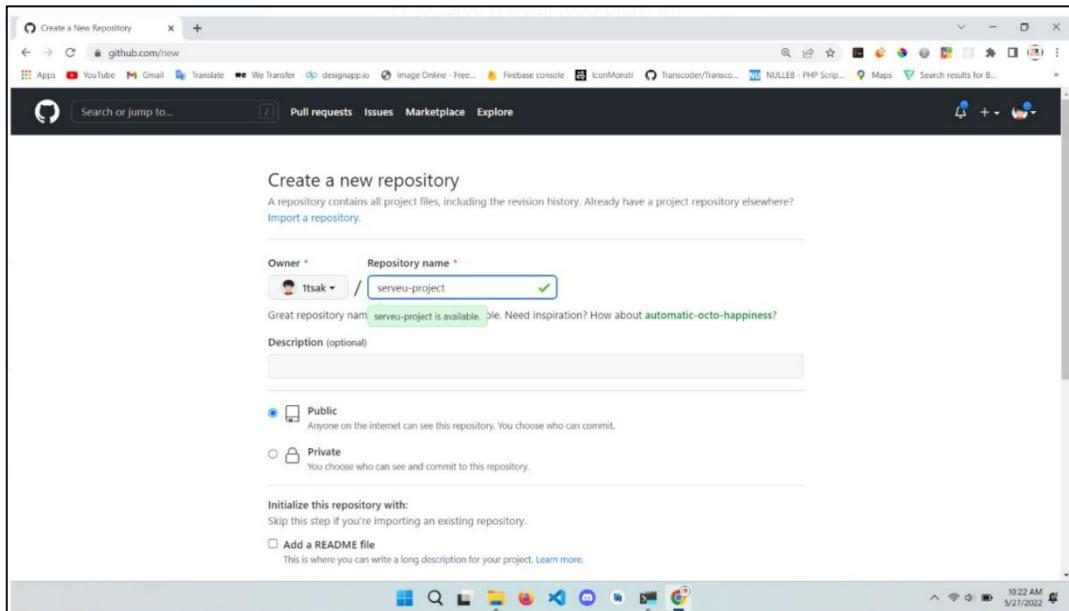

- 2) Click on the 'New' button in the top right corner.

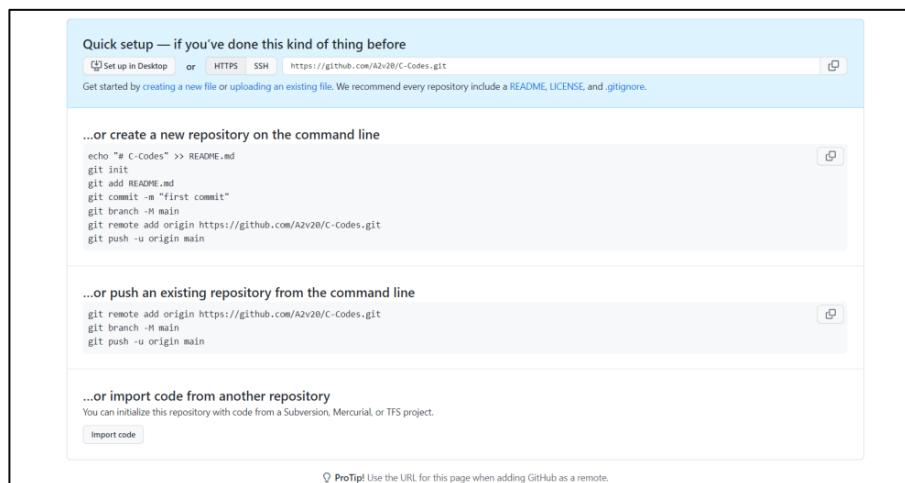

- 3) Enter the Repository name and add the description of the repository.

- 4) Select if you want the repository to be public or private.

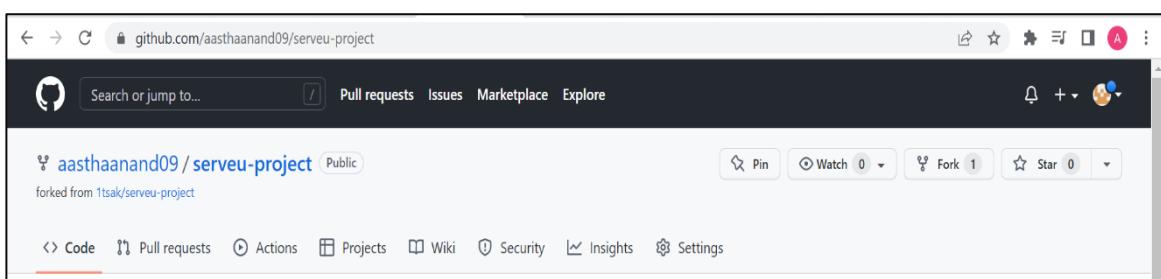

(Repository created by repository owner: team member- Aakash)

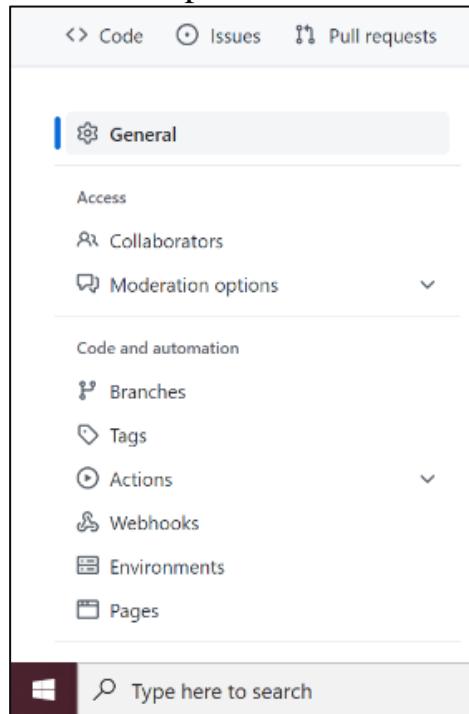

- 5) If you want to import code from an existing repository select the import code option.

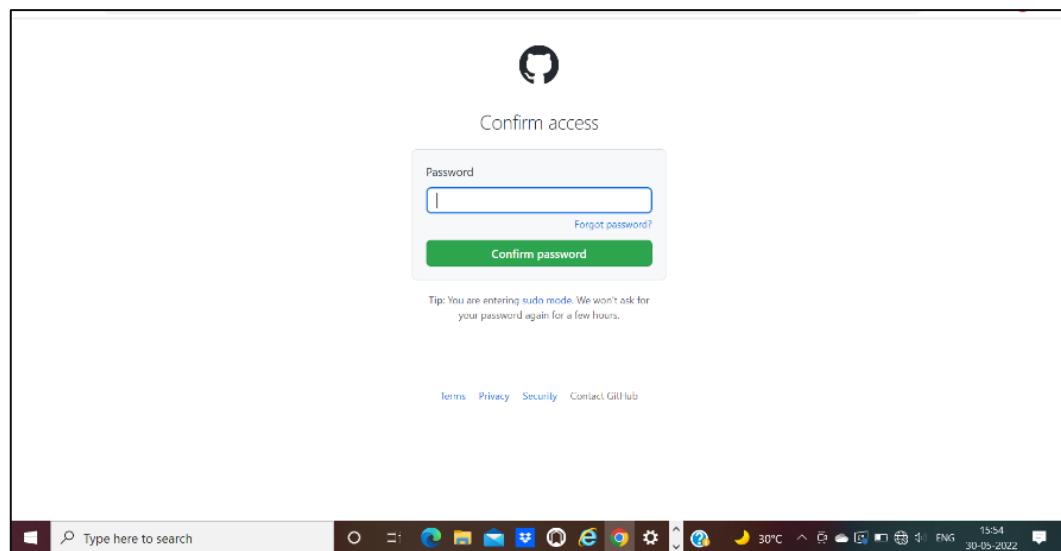

- 6) Now, you have created your repository successfully.  
 7) To add members to your repository open your repository and select settings option in the navigation bar.

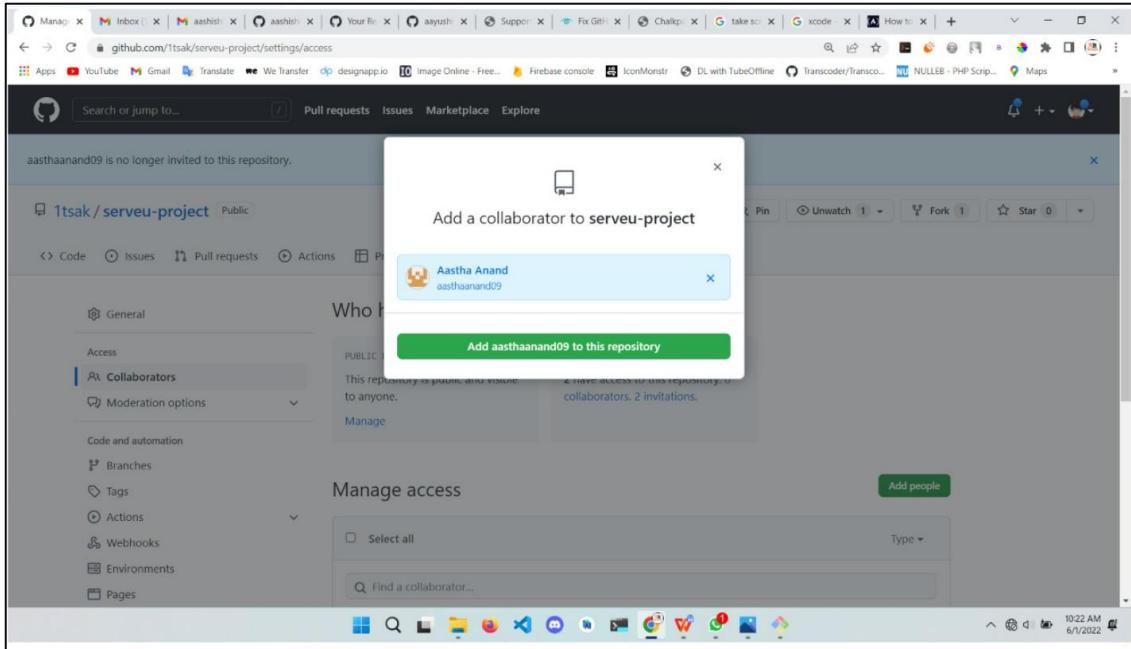

8) Click on Collaborators option under the access tab.

9) After clicking on collaborators GitHub asks you to enter your password to confirm the access to the repository.

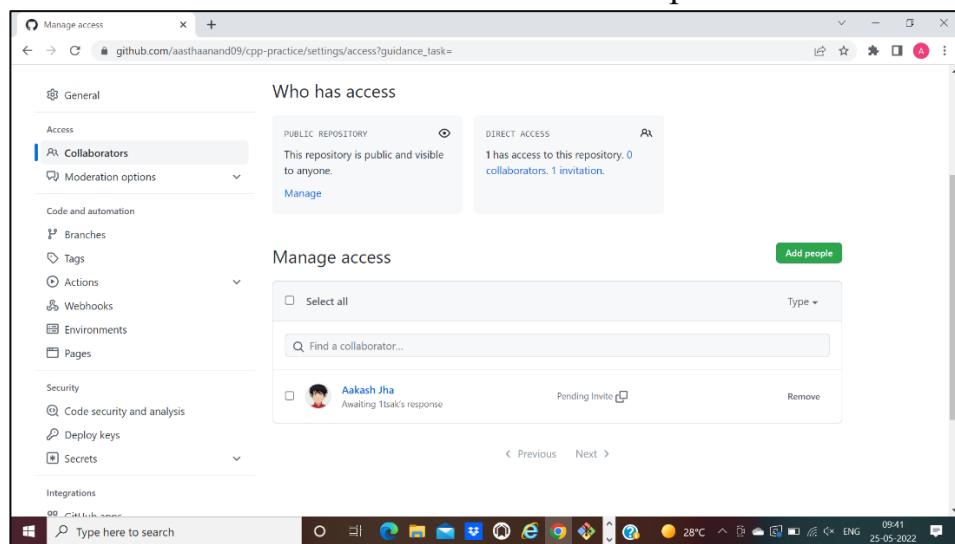

- 10) After entering the password you can manage access and add/remove team members to your project.
- 11) To add members click on the add people option and search the id of your respective team member.

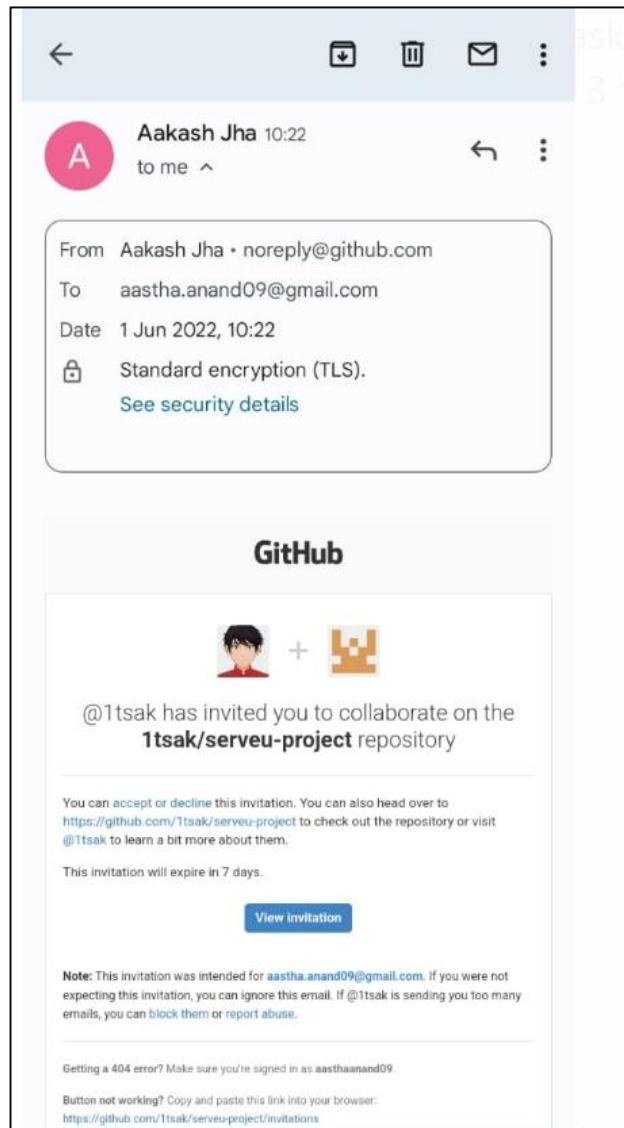

*(Collaborators added by repository owner: team member- Aakash)*

- 12) To remove any member click on remove option available in the last column of member's respective row.

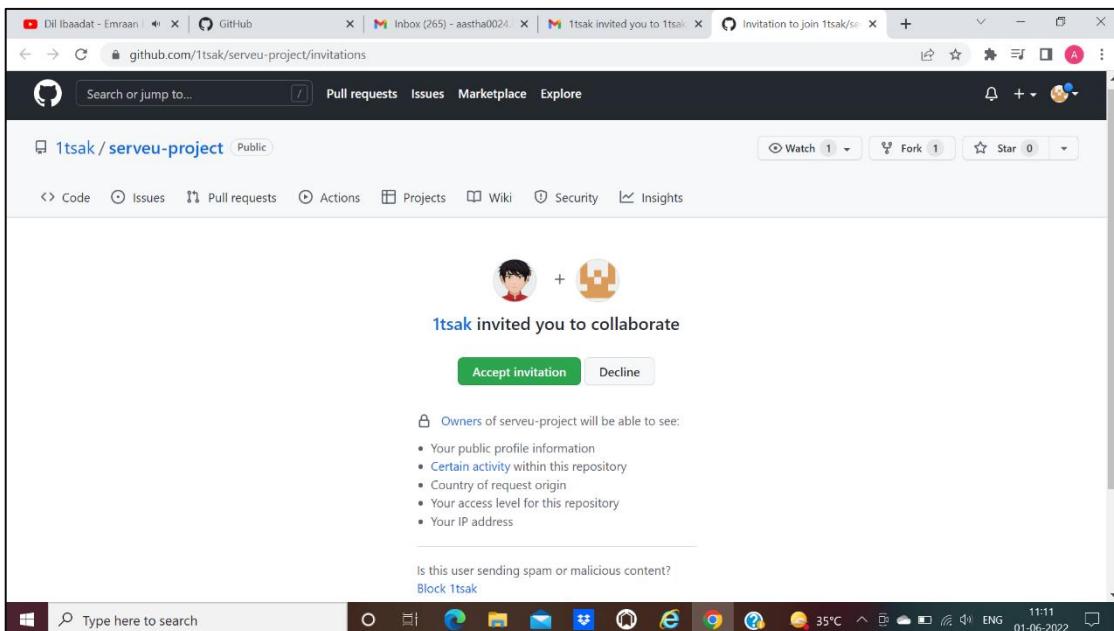

- 13) To accept the invitation from your team member, open your mail registered with GitHub.

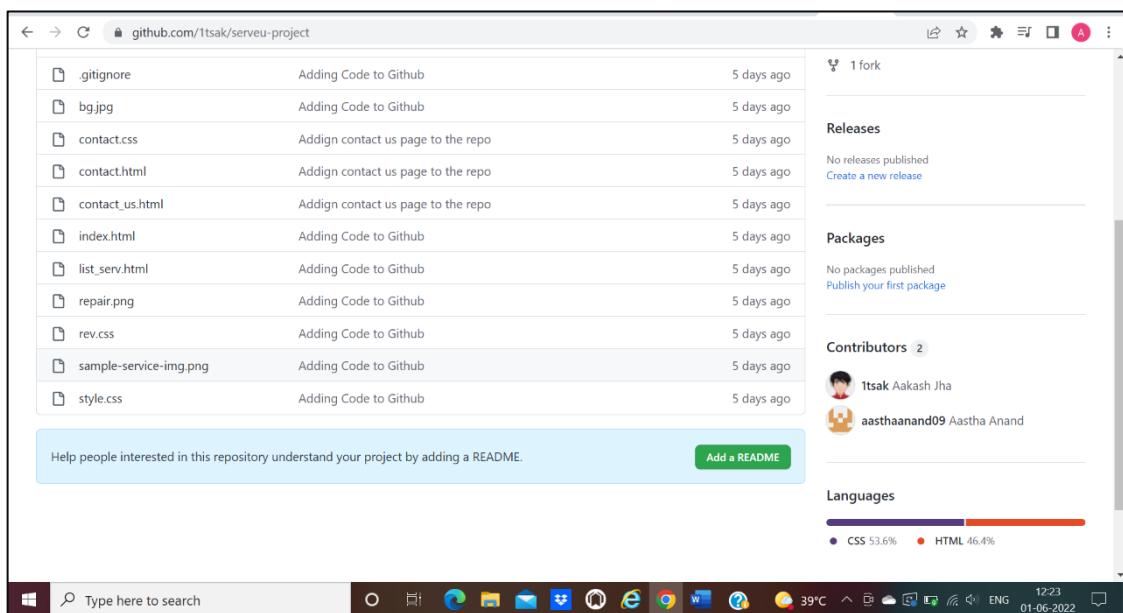

- 14) You will receive an invitation mail from the repository owner. Open the email and click on accept invitation.

- 15) You will be redirected to GitHub where you can either select to accept or decline the invitation.

- 16) You will be shown the option that you are now allowed to push.

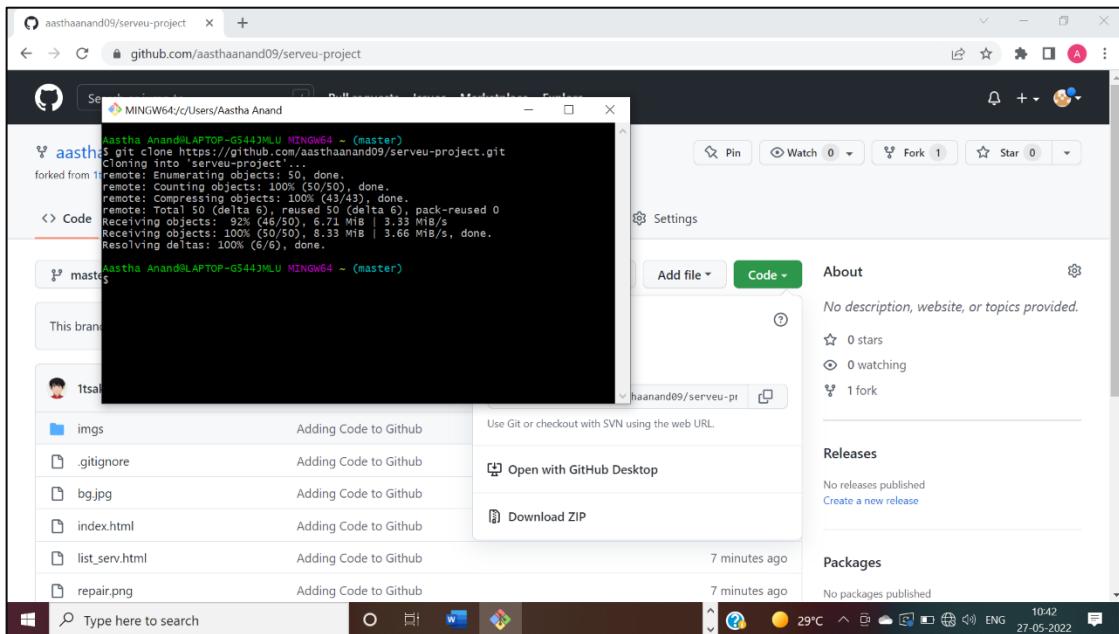

- 17) Now all members are ready to contribute to the project.

## Experiment No. 02

### Aim: Open and Close a Pull Request

- 1) To open a pull request we first have to make a new branch, by using git branch *branchname* option.

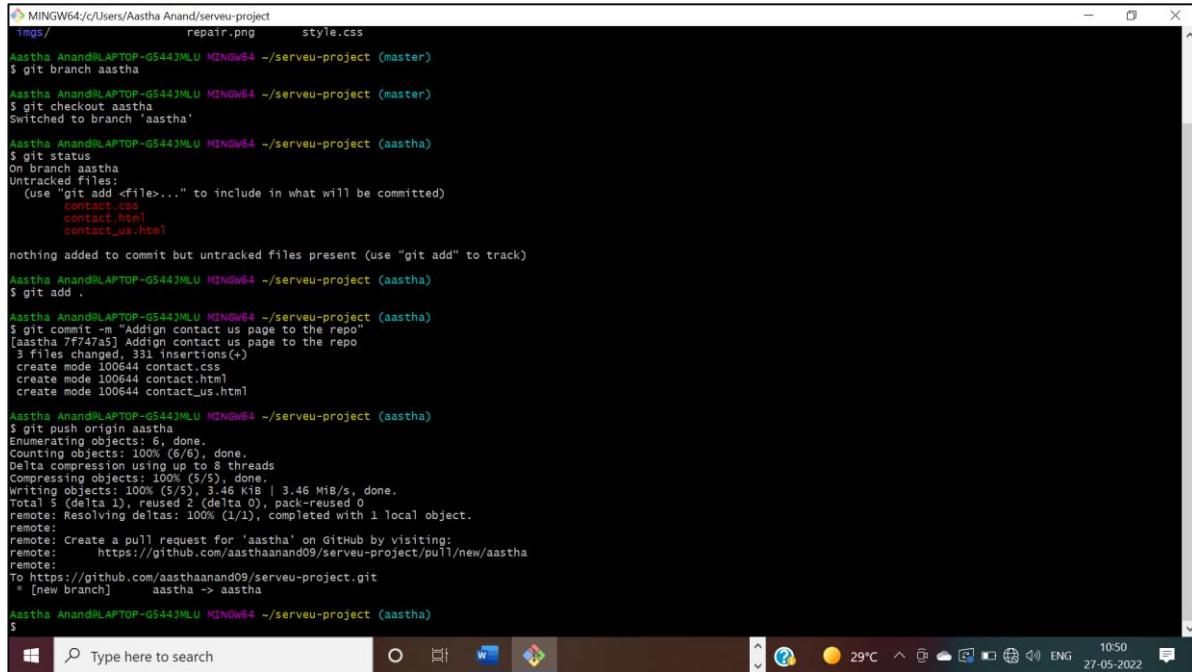

- 2) After making new branch we add a file to the branch or make changes in the existing file.

 * [new branch]      aastha > aastha

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/serveu-project (aastha)
$ 

```

- 5) After pushing new branch GitHub will either automatically ask you to create a pull request or you can create your own pull request.

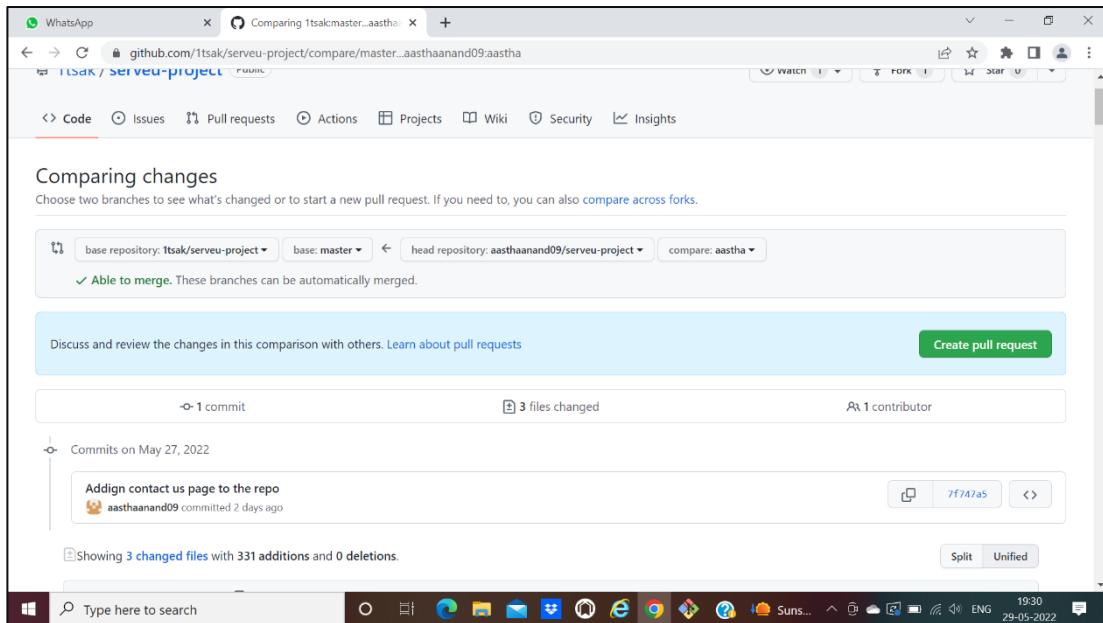

6) To create your own pull request, click on pull request option.

A screenshot of a web browser displaying the GitHub pull requests page for the repository '1tsak / serveu-project'. The URL in the address bar is 'github.com/1tsak/serveu-project/pulls'. The page shows a message: 'Label issues and pull requests for new contributors' with a 'Dismiss' button. Below it, a search bar contains the query 'is:pr is:open'. A green 'New pull request' button is visible. The filter bar at the top indicates '0 Open' and '1 Closed'. The main content area displays the message 'There aren't any open pull requests.' The browser's taskbar at the bottom shows various pinned icons and the date '01-06-2022'.

7) GitHub will detect any conflicts and ask you to enter a description of your pull request.

A screenshot of a web browser displaying the GitHub 'Open a pull request' interface. The URL is 'github.com/1tsak/serveu-project/compare/master...aasthaanand09:aastha'. The page title is 'Comparing 1tsak:master...aasthaanand09:aastha'. It shows a message: 'Create a new pull request by comparing changes across two branches. If you need to, you can also compare across forks.' Below this are dropdown menus for 'base repository: 1tsak/serveu-project', 'base: master', 'head repository: aasthaanand09/serveu-project', and 'compare: aastha'. A green note says '✓ Able to merge. These branches can be automatically merged.' The main form area has a title 'Adding contact us page to the repo' and a rich text editor with 'Write' and 'Preview' tabs. A comment input field says 'Leave a comment' and a file upload section says 'Attach files by dragging & dropping, selecting or pasting them.'. A green 'Create pull request' button is at the bottom. The browser's taskbar at the bottom shows various pinned icons and the date '29-05-2022'.

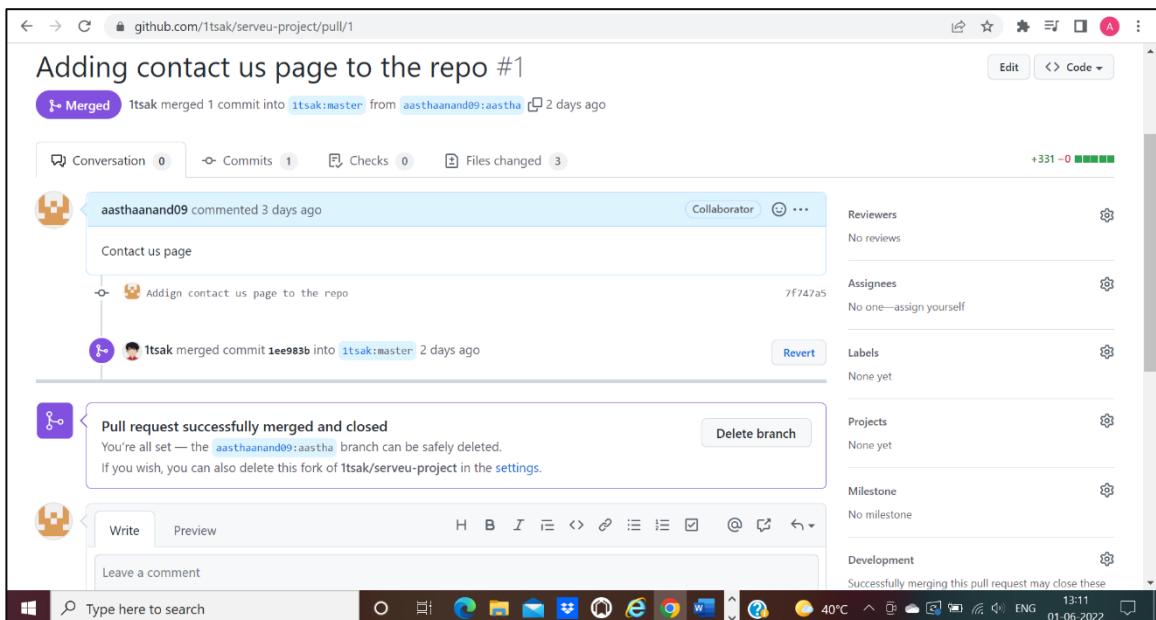

- 8) After opening a pull request all the team members will be sent the request if they want to merge or close the request.

- 9) If the team member chooses not to merge your pull request they will close your pull request.

10) To close the pull request simply click on close pull request and addcomment/ reason why you closed the pull request.

11) You can see all the pull request generated and how they were dealt with by clicking on pull request option.

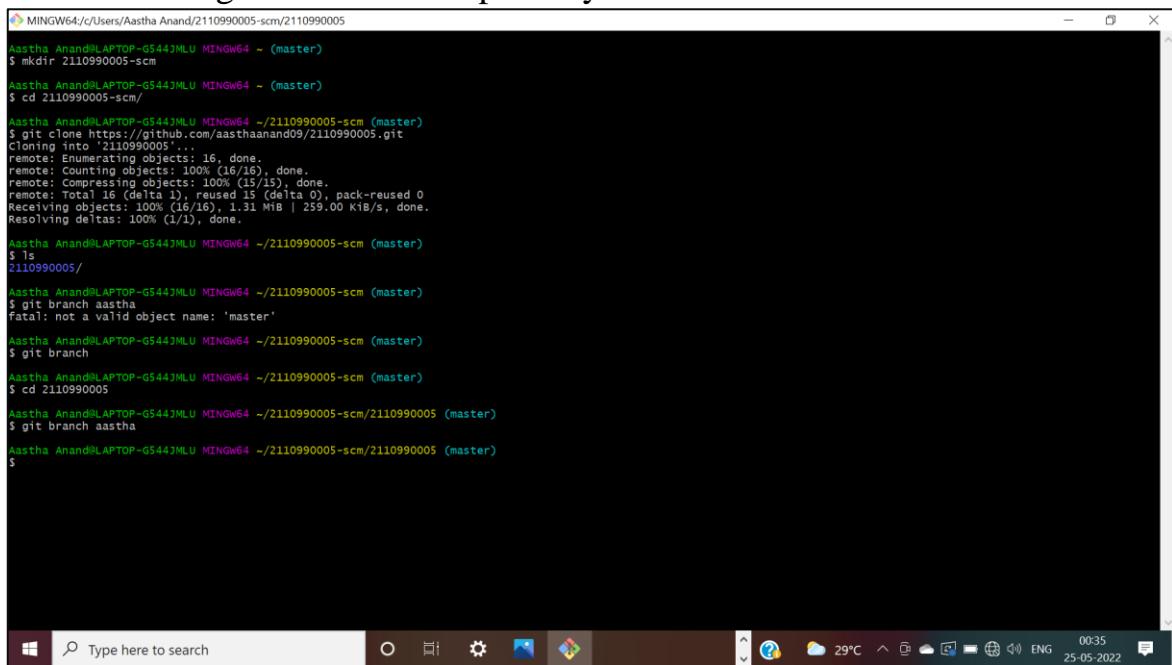

## Experiment No. 03

Aim: Create a pull request on a team member's repo and close pull requests generated by team members on own Repo as a maintainer

To create a pull request on a team member's repository and close requests by any other team members as a maintainer follow the procedure given below:

1. Do the required changes in the repository, add and commit these changes in the local repository in a new branch.

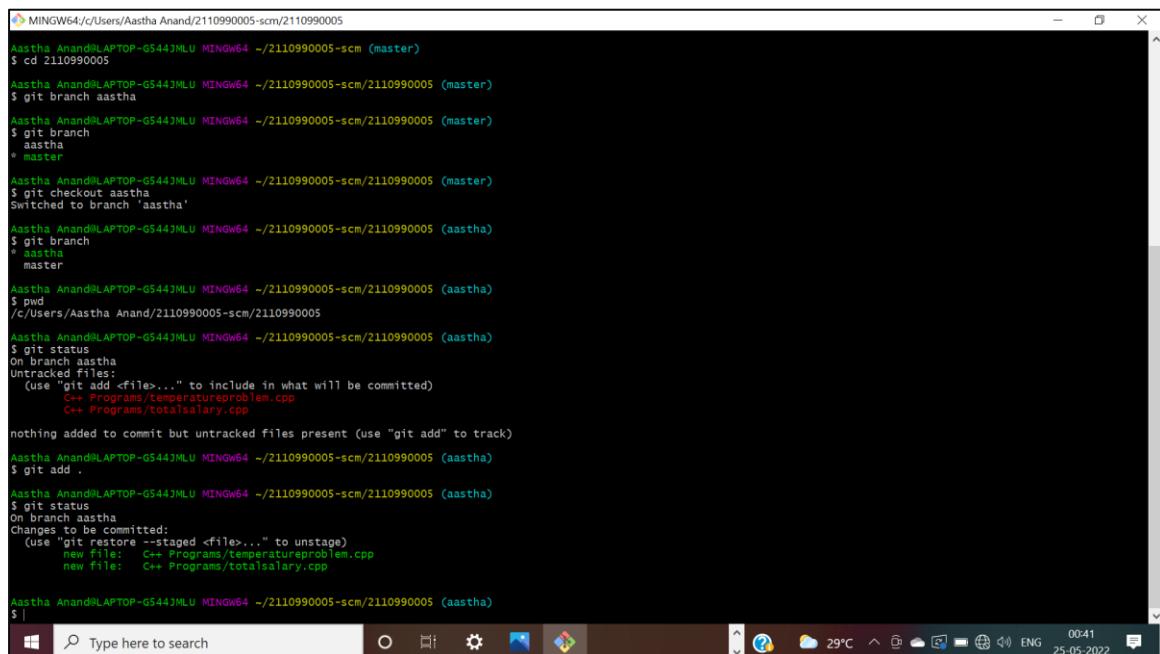

```
MINGW64:/c/Users/Aastha Anand/2110990005-scm/2110990005
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~ (master)
$ mkdir 2110990005-scm
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~ (master)
$ cd 2110990005-scm/
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm (master)
$ git clone https://github.com/aasthaaanand09/2110990005.git
Cloning into '2110990005'...
remote: Enumerating objects: 16, done.

Receiving objects: 100% (16/16) 1.31 MiB | 259.00 KiB/s, done.
Receiving deltas: 100% (1/1), done.

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm (master)
$ ls
2110990005/
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm (master)
$ git branch aastha
fatal: not a valid object name: 'master'

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm (master)
$ git branch
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm (master)
$ cd 2110990005

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (master)
$ git branch aastha
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (master)
$
```

2. Push the modified branch using `git push origin branchname`.

```
MINGW64:/c/Users/Aastha Anand/2110990005-scm/2110990005
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm (master)
$ cd 2110990005-scm/
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (master)
$ git branch aastha
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (master)
$ git branch
  aastha
* master

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (master)
$ git checkout aastha
Switched to branch 'aastha'

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (aastha)
$ git branch
* aastha
  master

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (aastha)
$ pwd
/c/Users/Aastha Anand/2110990005-scm/2110990005

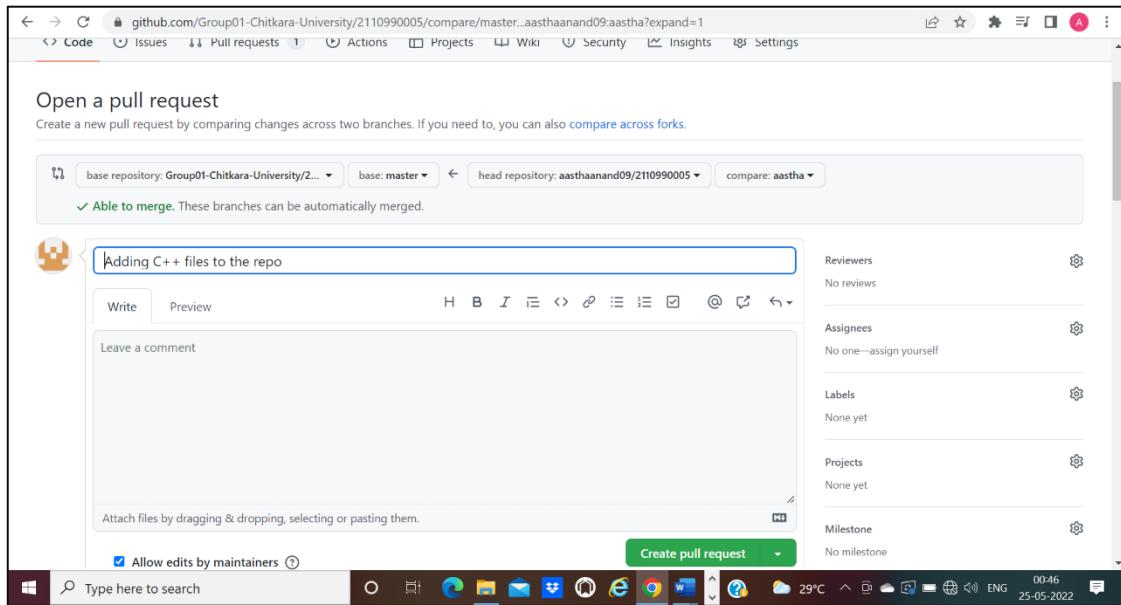

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (aastha)
$ git status
On branch aastha
Untracked files:
  (use "git add <file>..." to include in what will be committed)
    C++ Programs/temperatureproblem.cpp
    C++ Programs/totalsalary.cpp

nothing added to commit but untracked files present (use "git add" to track)

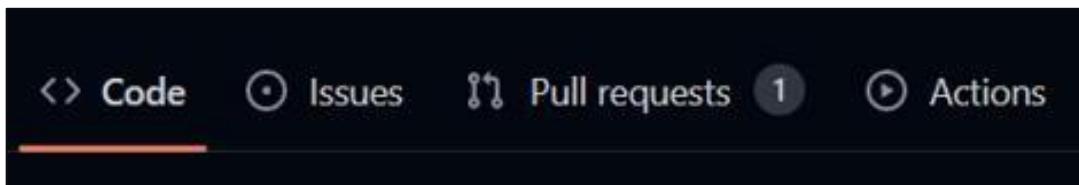

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (aastha)
$ git add .
Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (aastha)
$ git status
On branch aastha
Changes to be committed:
  (use "git restore --staged <file>..." to unstage)
    new file:   C++ Programs/temperatureproblem.cpp
    new file:   C++ Programs/totalsalary.cpp

Aastha Anand@LAPTOP-G544JMLU MINGW64 ~/2110990005-scm/2110990005 (aastha)
$
```

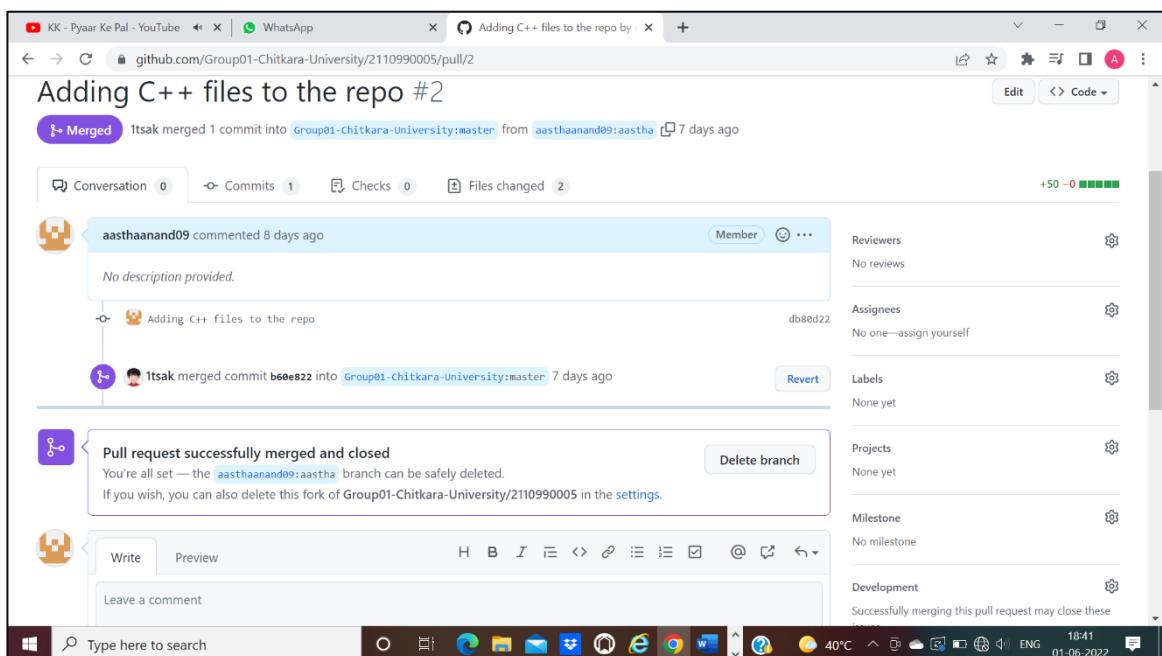

3. Open a pull request by following the procedure from the above experiment.

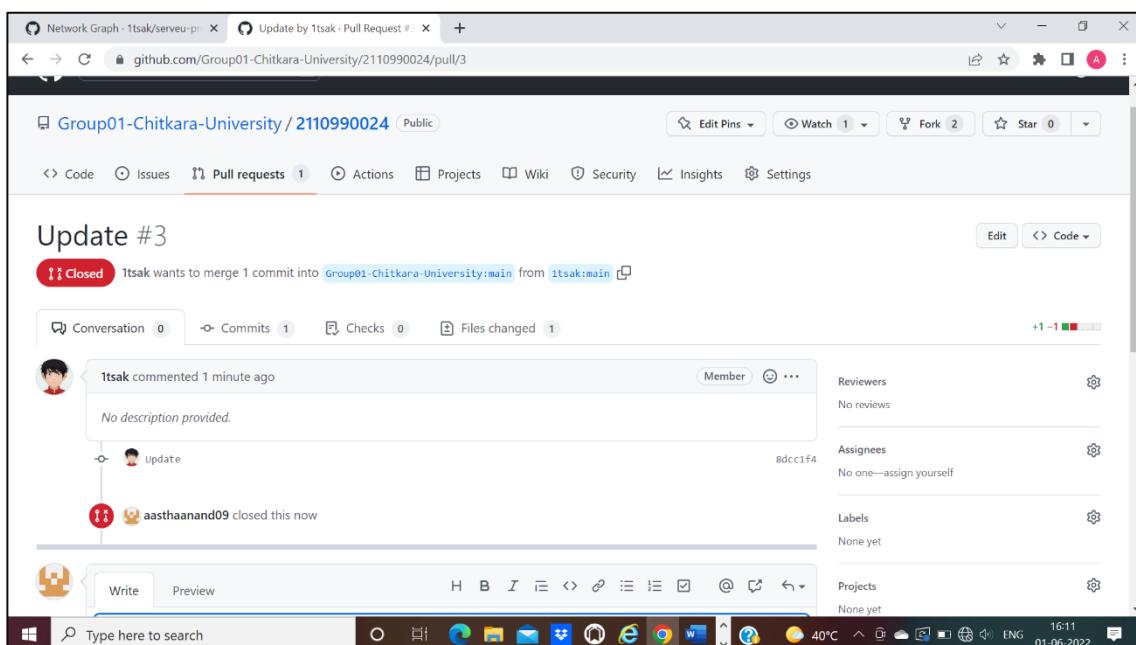

4. The pull request will be created and will be visible to all the team members.
5. Ask your team member to login to his/her Github account.
6. They will notice a new notification in the pull request menu.

7. Click on it. The pull request generated by you will be visible to them.

8. Click on the pull request. Two options will be available, either to close the pull request or Merge the request with the main branch.
  9. By selecting the merge branch option the main branch will get updated for all the team members.
10. By selecting close the pull request the pull request is not accepted and not merged with main branch.
11. The process is similar to closing and merging the pull request by you. It simply includes an external party to execute.
12. Thus, we conclude opening and closing of pull request. We also conclude merging of the pull request to the main branch.

## Experiment No. 04

### Aim: Publish and print network graphs

The network graph is one of the useful features for developers on GitHub. It is used to display the branch history of the entire repository network, including branches of the root repository and branches of forks that contain commits unique to the network.

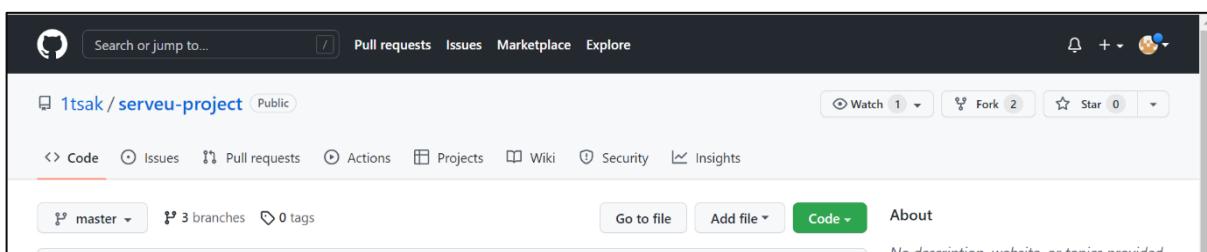

A repository's graphs give you information on traffic, projects that depend on the repository, contributors and commits to the repository, and a repository's forks and network. If you maintain a repository, you can use this data to get a better understanding of who's using your repository and why they're using it.

Some repository graphs are available only in public repositories with GitHub Free:

- Pulse
- Contributors
- Traffic
- Commits
- Code frequency
- Network

### Steps to access network graphs of respective repository

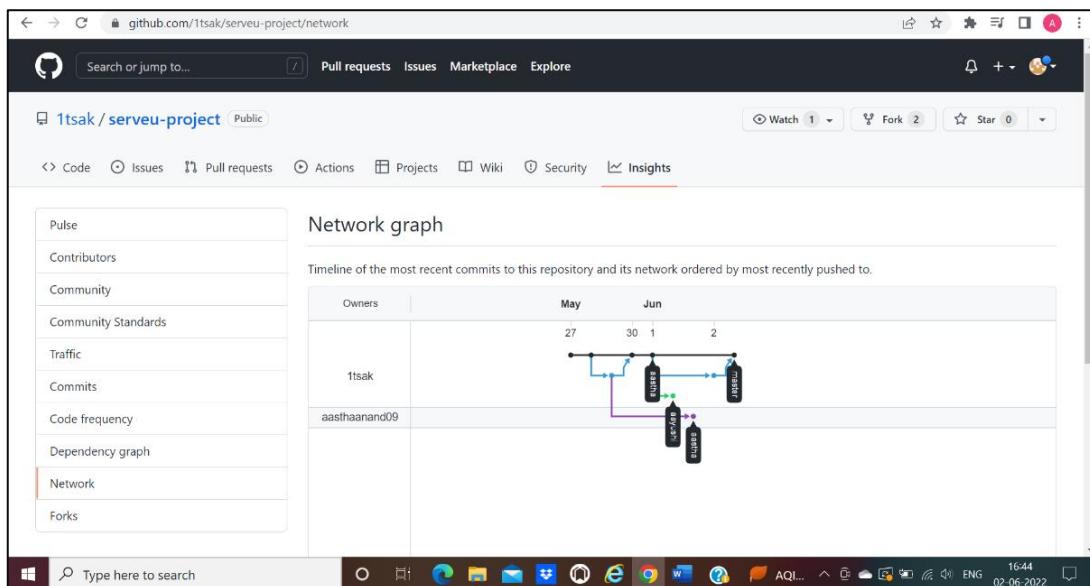

1. On GitHub.com, navigate to the main page of the repository.
2. Under your repository name, click **Insights**.

3. At the left sidebar, click on **Network**.

A screenshot of a GitHub repository page. The URL in the address bar is <https://github.com/1tsak/serveu-project>. The sidebar on the left contains links: Pulse, Contributors, Community, Community Standards, Traffic, Commits, Code frequency, Dependency graph, Network (which is highlighted with a red border), and Forks. Below the sidebar is a search bar with the placeholder "Type here to search".

4. You will get the network graph of your repository which displays the branch history of the entire repository network, including branches of the root repository and branches of forks that contain commits unique to the network.

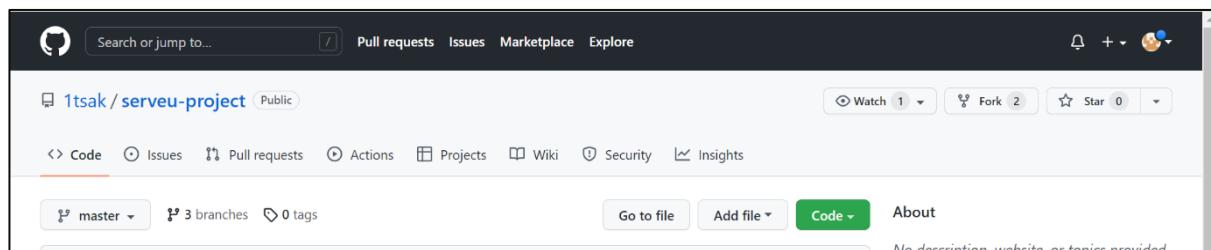

## Listing the forks of a repository

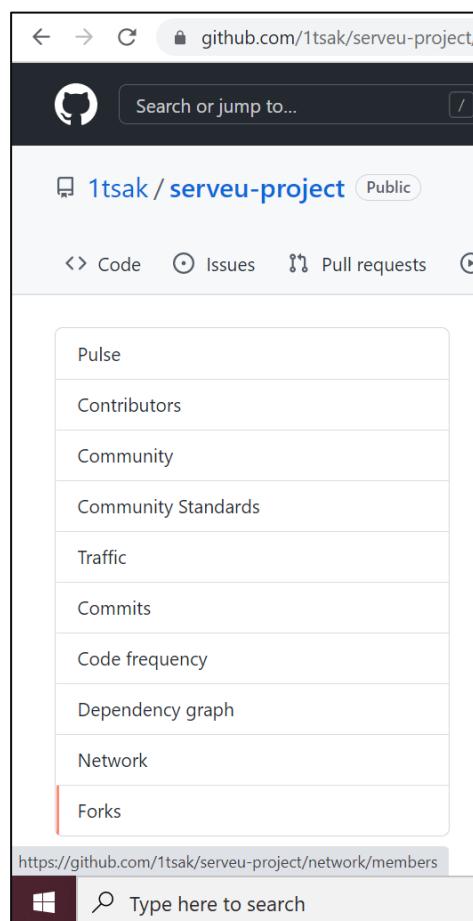

Forks are listed alphabetically by the username of the person who forked the repository

Clicking the number of forks shows you the full network. From there you can click "members" to see who forked the repo.

1. On GitHub.com, navigate to the main page of the repository.
2. Under your repository name, click **Insights**.

3. In the left sidebar, click **Forks**.

#### 4. Here you can see all the forks

### Viewing the dependencies of a repository

You can use the dependency graph to explore the code your repository depends on.

Almost all software relies on code developed and maintained by other developers, often known as a supply chain. For example, utilities, libraries, and frameworks. These dependencies are an integral part of your code and any bugs or vulnerabilities in them may affect your code. It's important to review and maintain these dependencies.
